7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

DEPRESSIONAL AND FLATS WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

D 1.0. Does the site have the potential to improve water quality?	
D 1.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet). points = 3 Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet. points = 2 ☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing points = 1 ☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch. points = 1	3
D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (*use NRCS definitions*). Yes = 4 No = 0	0
D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes): Wetland has persistent, ungrazed, plants > 95% of area points = 5 Wetland has persistent, ungrazed, plants > ½ of area points = 3 Wetland has persistent, ungrazed plants > $^1/_{10}$ of area points = 1 Wetland has persistent, ungrazed plants < $^1/_{10}$ of area points = 0	5
D 1.4. Characteristics of seasonal ponding or inundation: *This is the area that is ponded for at least 2 months. See description in manual.* Area seasonally ponded is > ½ total area of wetland points = 4 Area seasonally ponded is > ¼ total area of wetland points = 2 Area seasonally ponded is < ¼ total area of wetland points = 0	4
Total for D 1 Add the points in the boxes above	**12**

Rating of Site Potential If score is: ☑ **12 - 16 = H** ☐ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

D 2.0. Does the landscape have the potential to support the water quality function of the site?	
D 2.1. Does the wetland unit receive stormwater discharges? Yes = 1 No = 0	1
D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants? Yes = 1 No = 0	1
D 2.3. Are there septic systems within 250 ft of the wetland? Yes = 1 No = 0	0
D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3? Source Yes = 1 No = 0	0
Total for D 2 Add the points in the boxes above	**2**

Rating of Landscape Potential If score is: ☐ **3 or 4 = H** ☑ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

D 3.0. Is the water quality improvement provided by the site valuable to society?	
D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list? Yes = 1 No = 0	0
D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list? Yes = 1 No = 0	1
D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (*answer YES if there is a TMDL for the basin in which the unit is found*)? Yes = 2 No = 0	0
Total for D 3 Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

Wetland name or number WFW-04

DEPRESSIONAL AND FLATS WETLANDS

Hydrologic Functions - Indicators that the site functions to reduce flooding and stream degradation

D 4.0. Does the site have the potential to reduce flooding and erosion?	
D 4.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression with no surface water leaving it (no outlet) points = 4 Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet points = 2 Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch points = 1 Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing points = 0	4
D 4.2. Depth of storage during wet periods: *Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.* Marks of ponding are 3 ft or more above the surface or bottom of outlet points = 7 Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet points = 5 ☑ Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet points = 3 ☐ The wetland is a "headwater" wetland points = 3 Wetland is flat but has small depressions on the surface that trap water points = 1 Marks of ponding less than 0.5 ft (6 in) points = 0	3
D 4.3. Contribution of the wetland to storage in the watershed: *Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.* ☐ The area of the basin is less than 10 times the area of the unit points = 5 The area of the basin is 10 to 100 times the area of the unit points = 3 The area of the basin is more than 100 times the area of the unit points = 0 ☐ Entire wetland is in the Flats class points = 5	0
Total for D 4 Add the points in the boxes above	**7**

Rating of Site Potential If score is: ☐**12 - 16 = H** ☑**6 - 11 = M** ☐**0 - 5 = L** *Record the rating on the first page*

D 5.0. Does the landscape have the potential to support hydrologic function of the site?	
D 5.1. Does the wetland unit receive stormwater discharges? Yes = 1 No = 0	1
D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff? Yes = 1 No = 0	1
D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)? Yes = 1 No = 0	1
Total for D 5 Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑**3 = H** ☐**1 or 2 = M** ☐**0 = L** *Record the rating on the first page*

D 6.0. Are the hydrologic functions provided by the site valuable to society?	
D 6.1. The unit is in a landscape that has flooding problems. *Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.* The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds): ● Flooding occurs in a sub-basin that is immediately down-gradient of unit. points = 2 ☑ ● Surface flooding problems are in a sub-basin farther down-gradient. points = 1 ☐ Flooding from groundwater is an issue in the sub-basin. points = 1 ☐ The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why points = 0 ☐ There are no problems with flooding downstream of the wetland. points = 0	1
D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0	0
Total for D 6 Add the points in the boxes above	**1**

Rating of Value If score is: ☐**2 - 4 = H** ☑**1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

☐ Aquatic bed
☐ Emergent
☐ Scrub-shrub (areas where shrubs have > 30% cover)
☑ Forested (areas where trees have > 30% cover)
If the unit has a Forested class, check if :
☑ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

4 structures or more: points = 4
3 structures: points = 2
2 structures: points - 1
1 structure: points = 0

1

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

☐ Permanently flooded or inundated
☑ Seasonally flooded or inundated
☐ Occasionally flooded or inundated
☑ Saturated only
☐ Permanently flowing stream or river in, or adjacent to, the wetland
☐ Seasonally flowing stream in, or adjacent to, the wetland
☐ **Lake Fringe wetland** **2 points**
☐ **Freshwater tidal wetland** **2 points**

4 or more types present: points = 3
3 types present: points = 2
2 types present: points = 1
1 types present: points = 0

1

H 1.3. Richness of plant species

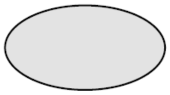
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

If you counted: > 19 species points = 2
5 - 19 species points = 1
< 5 species points = 0

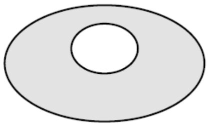
1

H 1.4. Interspersion of habitats

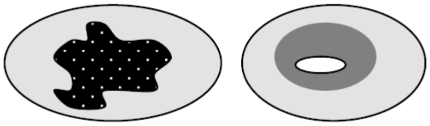
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points

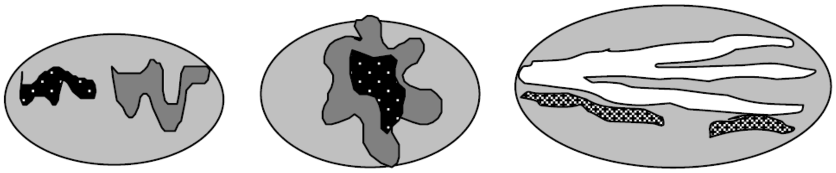


Low = 1 point



Moderate = 2 points

All three diagrams in this row are **HIGH** = 3 points



0

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☑ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☑ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☑ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	3
Total for H 1 Add the points in the boxes above	**6**

Rating of Site Potential If Score is: ☐**15 - 18 = H** ☐**7 - 14 = M** ☑**0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 2.6 % undisturbed habitat + (1.3 % moderate & low intensity land uses / 2) = 3.25% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 26.5 % undisturbed habitat + (18.2 % moderate & low intensity land uses / 2) = 35.6% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑**< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	1

Rating of Value If Score is: ☐ **2 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here: http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE****: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type | **Category**

Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,
☐ Vegetated, and
☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☐ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25)
☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☐ Yes - Go to **SC 2.2** ☑ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions*** .

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-05 Date of site visit: 10/23/2019

Rated by A. Weiss Trained by Ecology? ☑ Yes ☐ No Date of training Oct. 2020

HGM Class used for rating Riverine & Fresh Water Tidal Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☑ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☑ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☑ NO - go to 7 ☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☑ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event:		2
Depressions cover > $^{3}/_{4}$ area of wetland	points = 8	
Depressions cover > ½ area of wetland	points = 4	
Depressions present but cover < ½ area of wetland	points = 2	
No depressions present	points = 0	
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes)		8
Trees or shrubs > $^{2}/_{3}$ area of the wetland	points = 8	
☐ Trees or shrubs > $^{1}/_{3}$ area of the wetland	points = 6	
☐ Herbaceous plants (> 6 in high) > $^{2}/_{3}$ area of the wetland	points = 6	
Herbaceous plants (> 6 in high) > $^{1}/_{3}$ area of the wetland	points = 3	
Trees, shrubs, and ungrazed herbaceous < $^{1}/_{3}$ area of the wetland	points = 0	
Total for R 1	Add the points in the boxes above	**10**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	Yes = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	Yes = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	Yes = 1 No = 0	0
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	1
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1 - R 2.4? Other Sources	Yes = 1 No = 0	0
Total for R 2	Add the points in the boxes above	**4**

Rating of Landscape Potential If score is: ☑ **3 - 6 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 No = 0	0
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	Yes = 1 No = 0	0
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	Yes = 2 No = 0	0
Total for R 3	Add the points in the boxes above	**0**

Rating of Value If score is: ☐ **2 - 4 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

Wetland name or number WFW-05

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?		
R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).*		2
If the ratio is more than 20	points = 9	
If the ratio is 10 - 20	points = 6	
If the ratio is 5 - < 10	points = 4	
If the ratio is 1 - < 5	points = 2	
If the ratio is < 1	points = 1	
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are NOT Cowardin classes).*		7
Forest or shrub for > $^{1}/_{3}$ area OR emergent plants > $^{2}/_{3}$ area	points = 7	
Forest or shrub for > $^{1}/_{10}$ area OR emergent plants > $^{1}/_{3}$ area	points = 4	
Plants do not meet above criteria	points = 0	
Total for R 4	Add the points in the boxes above	**9**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?		
R 5.1. Is the stream or river adjacent to the wetland downcut?	Yes = 0 No = 1	1
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	Yes = 1 No = 0	1
R 5.3 Is the up-gradient stream or river controlled by dams?	Yes = 0 No = 1	1
Total for R 5	Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?		
R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.*		1
The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
Total for R 6	Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes. **HABITAT FUNCTIONS** - Indicators that site functions to provide important habitat	
H 1.0. Does the site have the potential to provide habitat?	
H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.* ☐ Aquatic bed — 4 structures or more: points = 4 ☐ Emergent — 3 structures: points = 2 ☐ Scrub-shrub (areas where shrubs have > 30% cover) — 2 structures: points - 1 ☑ Forested (areas where trees have > 30% cover) — 1 structure: points = 0 *If the unit has a Forested class, check if*: ☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon	0
H 1.2. Hydroperiods Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*). ☐ Permanently flooded or inundated — 4 or more types present: points = 3 ☑ Seasonally flooded or inundated — 3 types present: points = 2 ☑ Occasionally flooded or inundated — 2 types present: points = 1 ☐ Saturated only — 1 types present: points = 0 ☐ Permanently flowing stream or river in, or adjacent to, the wetland ☑ Seasonally flowing stream in, or adjacent to, the wetland ☐ **Lake Fringe wetland** — **2 points** ☐ **Freshwater tidal wetland** — **2 points**	2
H 1.3. Richness of plant species Count the number of plant species in the wetland that cover at least 10 ft^2. *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species.* ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*** If you counted: > 19 species — points = 2 5 - 19 species — points = 1 < 5 species — points = 0	1
H 1.4. Interspersion of habitats Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*  **None** = 0 points  **Low** = 1 point  **Moderate** = 2 points All three diagrams in this row are **HIGH** = 3 points 	1

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☑ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☑ Standing snags (dbh > 4 in) within the wetland ☑ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☑ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	4
Total for H 1 Add the points in the boxes above	**8**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☑ **7 - 14 = M** ☐ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?		
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 2.8 % undisturbed habitat + (1.4 % moderate & low intensity land uses / 2) = 3.5% If total accessible habitat is:		0
> $^1/_3$ (33.3%) of 1 km Polygon	points = 3	
20 - 33% of 1 km Polygon	points = 2	
10 - 19% of 1 km Polygon	points = 1	
< 10 % of 1 km Polygon	points = 0	
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 20.1 % undisturbed habitat + (18.8 % moderate & low intensity land uses / 2) = 29.5%		1
Undisturbed habitat > 50% of Polygon	points = 3	
Undisturbed habitat 10 - 50% and in 1-3 patches	points = 2	
Undisturbed habitat 10 - 50% and > 3 patches	points = 1	
Undisturbed habitat < 10% of 1 km Polygon	points = 0	
H 2.3 Land use intensity in 1 km Polygon: If		-2
> 50% of 1 km Polygon is high intensity land use	points = (-2)	
≤ 50% of 1km Polygon is high intensity	points = 0	
Total for H 2	Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?		
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*.		2
Site meets ANY of the following criteria: ☑ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan	points = 2	
Site has 1 or 2 priority habitats (listed on next page) with in 100m	points = 1	
Site does not meet any of the criteria above	points = 0	

Rating of Value If Score is: ☑ **2 = H** ☐ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here: http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE*** *: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☑ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.	

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,
☐ Vegetated, and
☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☑ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25)
☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☐ Yes - Go to **SC 2.2** ☑ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions*** *.*

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103
☐ Grayland-Westport: Lands west of SR 105
☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-06 Date of site visit: 10/23/2019

Rated by A. Weiss Trained by Ecology? ☐ Yes ☐ No Date of training Oct. 2020

HGM Class used for rating Slope Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).

OVERALL WETLAND CATEGORY IV (based on functions ☑ or special characteristics ☐)

1. Category of wetland based on FUNCTIONS

_____ **Category I** - Total score = 23 - 27
_____ **Category II** - Total score = 20 - 22
_____ **Category III** - Total score = 16 - 19
X **Category IV** - Total score = 9 - 15

FUNCTION	**Improving Water Quality**	**Hydrologic**	**Habitat**	
		List appropriate rating (H, M, L)		
Site Potential	L	L	L	
Landscape Potential	M	M	L	
Value	M	M	H	**Total**
Score Based on Ratings	5	5	5	**15**

Score for each function based on three ratings
(*order of ratings is not important*)

9 = H, H, H
8 = H, H, M
7 = H, H, L
7 = H, M, M
6 = H, M, L
6 = M, M, M
5 = H, L, L
5 = M, M, L
4 = M, L, L
3 = L, L, L

2. Category based on SPECIAL CHARACTERISTICS of wetland

CHARACTERISTIC	**Category**
Estuarine	
Wetland of High Conservation Value	
Bog	
Mature Forest	
Old Growth Forest	
Coastal Lagoon	
Interdunal	
None of the above	**X**

Wetland name or number __WFW-06______

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (*can be added to map of hydroperiods*)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (*can be added to another figure*)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	L 3.1, L 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	L 3.3	

Slope Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Plant cover of **dense** trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of **dense, rigid** trees, shrubs, and herbaceous plants (*can be added to another figure*)	S 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☐ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☐ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☐ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☐ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7 ☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

SLOPE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

S 1.0. Does the site have the potential to improve water quality?	
S 1.1. Characteristics of the average slope of the wetland: (*a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance*) Slope is 1% or less points = 3 Slope is > 1% - 2% points = 2 Slope is > 2% - 5% points = 1 Slope is greater than 5% points = 0	1
S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (*use NRCS definitions*): Yes = 3 No = 0	0
S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants: Choose the points appropriate for the description that best fits the plants in the wetland. *Dense means you have trouble seeing the soil surface (>75% cover), and uncut means not grazed or mowed and plants are higher than 6 in.* Dense, uncut, herbaceous plants > 90% of the wetland area points = 6 Dense, uncut, herbaceous plants > ½ of area points = 3 Dense, woody, plants > ½ of area points = 2 Dense, uncut, herbaceous plants > ¼ of area points = 1 Does not meet any of the criteria above for plants points = 0	3
Total for S 1 Add the points in the boxes above	**4**

Rating of Site Potential If score is: ☐ **12 = H** ☐ **6 - 11 = M** ☑ **0 - 5 = L** *Record the rating on the first page*

S 2.0. Does the landscape have the potential to support the water quality function of the site?	
S 2.1. Is > 10% of the area within 150 ft on the uphill side of the wetland in land uses that generate pollutants? Yes = 1 No = 0	1
S 2.2. Are there other sources of pollutants coming into the wetland that are not listed in question S 2.1? Other Sources stormwater outfalls Yes = 1 No = 0	1
Total for S 2 Add the points in the boxes above	**2**

Rating of Landscape Potential If score is: ☑ **1 - 2 = M** ☐ **0 = L** *Record the rating on the first page*

S 3.0. Is the water quality improvement provided by the site valuable to society?	
S 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list? Yes = 1 No = 0	0
S 3.2. Is the wetland in a basin or sub-basin where water quality is an issue? *At least one aquatic resource in the basin is on the 303(d) list.* Yes = 1 No = 0	1
S 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? A*nswer YES if there is a TMDL for the basin in which the unit is found*? Yes = 2 No = 0	0
Total for S 3 Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

SLOPE WETLANDS

Hydrologic Functions - Indicators that the site functions to reduce flooding and stream erosion

S 4.0. Does the site have the potential to reduce flooding and stream erosion?	
S 4.1. Characteristics of plants that reduce the velocity of surface flows during storms: Choose the points appropriate for the description that best fits conditions in the wetland. *Stems of plants should be thick enough (usually > $^1/_8$ in), or dense enough, to remain erect during surface flows.* Dense, uncut, **rigid** plants cover > 90% of the area of the wetland points = 1 All other conditions points = 0	0

Rating of Site Potential If score is: ☐**1 = M** ☑**0 = L** *Record the rating on the first page*

S 5.0. Does the landscape have the potential to support hydrologic functions of the site?	
S 5.1. Is more than 25% of the area within 150 ft upslope of wetland in land uses or cover that generate excess surface runoff? Yes = 1 No = 0	1

Rating of Landscape Potential If score is: ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

S 6.0. Are the hydrologic functions provided by the site valuable to society?	
S 6.1. Distance to the nearest areas downstream that have flooding problems: The sub-basin immediately down-gradient of site has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds) points = 2 Surface flooding problems are in a sub-basin farther down-gradient points = 1 No flooding problems anywhere downstream points = 0	1
S 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0	0
Total for S 6 Add the points in the boxes above	**1**

Rating of Value If score is: ☐**2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

NOTES and FIELD OBSERVATIONS:

These questions apply to wetlands of all HGM classes.	
HABITAT FUNCTIONS - Indicators that site functions to provide important habitat	
H 1.0. Does the site have the potential to provide habitat?	
H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.* ☐ Aquatic bed 4 structures or more: points = 4 ☐ Emergent 3 structures: points = 2 ☑ Scrub-shrub (areas where shrubs have > 30% cover) 2 structures: points - 1 ☐ Forested (areas where trees have > 30% cover) 1 structure: points = 0 *If the unit has a Forested class, check if*: ☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon	0
H 1.2. Hydroperiods Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*). ☐ Permanently flooded or inundated 4 or more types present: points = 3 ☐ Seasonally flooded or inundated 3 types present: points = 2 ☑ Occasionally flooded or inundated 2 types present: points = 1 ☐ Saturated only 1 types present: points = 0 ☐ Permanently flowing stream or river in, or adjacent to, the wetland ☐ Seasonally flowing stream in, or adjacent to, the wetland ☐ **Lake Fringe wetland** **2 points** ☐ **Freshwater tidal wetland** **2 points**	0
H 1.3. Richness of plant species Count the number of plant species in the wetland that cover at least 10 ft^2. *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species.* ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*** If you counted: > 19 species points = 2 5 - 19 species points = 1 < 5 species points = 0	1
H 1.4. Interspersion of habitats Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*  **None** = 0 points  **Low** = 1 point  **Moderate** = 2 points All three diagrams in this row are **HIGH** = 3 points 	0

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☑ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☐ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☑ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	2
Total for H 1 Add the points in the boxes above	**3**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☐ **7 - 14 = M** ☑ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 2.8 % undisturbed habitat + (1.4 % moderate & low intensity land uses / 2) = 3.5% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 26.9 % undisturbed habitat + (22.2 % moderate & low intensity land uses / 2) = 38% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☑ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	2

Rating of Value If Score is: ☑ **2 = H** ☐ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here: http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE****: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☑ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

Wetland name or number WFW-06

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type *Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.*	**Category**
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? ☐ The dominant water regime is tidal, ☐ Vegetated, and ☐ With a salinity greater than 0.5 ppt ☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? ☐ Yes = **Category I** ☐ No - Go to **SC 1.2**	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina*, see page 25) ☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. ☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. ☐ Yes = **Category I** ☐ No = **Category II**	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? ☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3** SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? ☐ Yes = **Category I** ☑ No = **Not WHCV** SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf ☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV** SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? ☐ Yes = **Category I** ☐ No = **Not WHCV**	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below. **If you answer YES you will still need to rate the wetland based on its functions**.* SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? ☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2** SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? ☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog** SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? ☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4** **NOTE**: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? ☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^{2})

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-07 Date of site visit: 11/6/2019

Rated by A. Thom, S. Kreuger Trained by Ecology? ☑ Yes ☐ No Date of training Jul-18

HGM Class used for rating Riverine & Fresh Water Tidal Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).
Source of base aerial photo/map ESRI / Google Earth Pro

OVERALL WETLAND CATEGORY III (based on functions ☑ or special characteristics ☐)

1. Category of wetland based on FUNCTIONS

____ **Category I** - Total score = 23 - 27
____ **Category II** - Total score = 20 - 22
X **Category III** - Total score = 16 - 19
____ **Category IV** - Total score = 9 - 15

FUNCTION	Improving Water Quality	Hydrologic	Habitat	
	List appropriate rating (H, M, L)			
Site Potential	M	L	L	
Landscape Potential	H	H	L	
Value	L	M	M	**Total**
Score Based on Ratings	6	6	4	**16**

Score for each function based on three ratings (*order of ratings is not important*)

9 = H, H, H
8 = H, H, M
7 = H, H, L
7 = H, M, M
6 = H, M, L
6 = M, M, M
5 = H, L, L
5 = M, M, L
4 = M, L, L
3 = L, L, L

2. Category based on SPECIAL CHARACTERISTICS of wetland

CHARACTERISTIC	Category
Estuarine	
Wetland of High Conservation Value	
Bog	
Mature Forest	
Old Growth Forest	
Coastal Lagoon	
Interdunal	
None of the above	X

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (*can be added to map of hydroperiods*)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2

Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for ***Riverine*** *wetlands. If it is Saltwater Tidal Fringe it is an* ***Estuarine*** *wetland and is not scored. This method* ***cannot*** *be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
If your wetland can be classified as a Flats wetland, use the form for ***Depressional*** *wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☐ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☑ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☑ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☑ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7 ☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event: Depressions cover > 3/4 area of wetland Depressions cover > ½ area of wetland Depressions present but cover < ½ area of wetland No depressions present	points = 8 points = 4 points = 2 points = 0	0
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes) Trees or shrubs > 2/3 area of the wetland ☑ Trees or shrubs > 1/3 area of the wetland ☐ Herbaceous plants (> 6 in high) > 2/3 area of the wetland Herbaceous plants (> 6 in high) > 1/3 area of the wetland Trees, shrubs, and ungrazed herbaceous < 1/3 area of the wetland	points = 8 points = 6 points = 6 points = 3 points = 0	6
Total for R 1	Add the points in the boxes above	**6**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	Yes = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	Yes = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	Yes = 1 No = 0	0
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	1
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1 - R 2.4? Other Sources	Yes = 1 No = 0	0
Total for R 2	Add the points in the boxes above	**4**

Rating of Landscape Potential If score is: ☑ **3 - 6 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 No = 0	0
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	Yes = 1 No = 0	0
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	Yes = 2 No = 0	0
Total for R 3	Add the points in the boxes above	**0**

Rating of Value If score is: ☐ **2 - 4 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?		
R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).*		2
If the ratio is more than 20	points = 9	
If the ratio is 10 - 20	points = 6	
If the ratio is 5 - < 10	points = 4	
If the ratio is 1 - < 5	points = 2	
If the ratio is < 1	points = 1	
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are* *NOT Cowardin* *classes*).		4
Forest or shrub for > $^1/_3$ area OR emergent plants > $^2/_3$ area	points = 7	
Forest or shrub for > $^1/_{10}$ area OR emergent plants > $^1/_3$ area	points = 4	
Plants do not meet above criteria	points = 0	
Total for R 4	Add the points in the boxes above	**6**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☐ **6 - 11 = M** ☑ **0 - 5 = L** *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?		
R 5.1. Is the stream or river adjacent to the wetland downcut?	Yes = 0 No = 1	1
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	Yes = 1 No = 0	1
R 5.3 Is the up-gradient stream or river controlled by dams?	Yes = 0 No = 1	1
Total for R 5	Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?		
R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.*		1
The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
Total for R 6	Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

☐ Aquatic bed — 4 structures or more: points = 4
☑ Emergent — 3 structures: points = 2
☑ Scrub-shrub (areas where shrubs have > 30% cover) — 2 structures: points - 1
☐ Forested (areas where trees have > 30% cover) — 1 structure: points = 0
If the unit has a Forested class, check if:
☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

1

H 1.2. Hydroperiods
Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

☐ Permanently flooded or inundated — 4 or more types present: points = 3
☑ Seasonally flooded or inundated — 3 types present: points = 2
☐ Occasionally flooded or inundated — 2 types present: points = 1
☐ Saturated only — 1 types present: points = 0
☐ Permanently flowing stream or river in, or adjacent to, the wetland
☑ Seasonally flowing stream in, or adjacent to, the wetland
☐ **Lake Fringe wetland** — **2 points**
☐ **Freshwater tidal wetland** — **2 points**

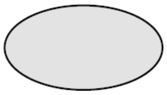
1

H 1.3. Richness of plant species
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

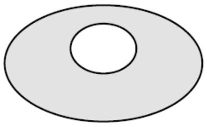
If you counted:	> 19 species	points = 2
	5 - 19 species	points = 1
	< 5 species	points = 0

1

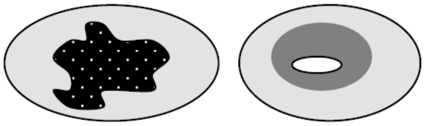
H 1.4. Interspersion of habitats
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points

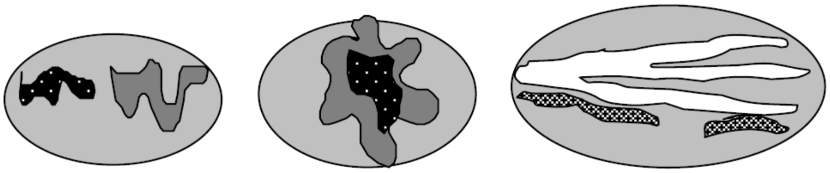


Low = 1 point



Moderate = 2 points

All three diagrams in this row are **HIGH** = 3 points



1

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☐ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☐ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☑ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☑ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	2
Total for H 1 Add the points in the boxes above	**6**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☐ **7 - 14 = M** ☑ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0 % undisturbed habitat + (0.1 % moderate & low intensity land uses / 2) = 0.05% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 13.7 % undisturbed habitat + (17.7 % moderate & low intensity land uses / 2) = 22.55% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	1

Rating of Value If Score is: ☐ **2 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

Wetland name or number WFW-07

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE**: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type *Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.*	**Category**
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? ☐ The dominant water regime is tidal, ☐ Vegetated, and ☐ With a salinity greater than 0.5 ppt ☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? ☐ Yes = **Category I** ☐ No - Go to **SC 1.2**	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25) ☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. ☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. ☐ Yes = **Category I** ☑ No = **Category II**	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? ☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3** SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? ☐ Yes = **Category I** ☑ No = **Not WHCV** SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf ☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV** SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? ☐ Yes = **Category I** ☐ No = **Not WHCV**	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions*** *.* SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? ☑ Yes - Go to **SC 3.3** ☐ No - Go to **SC 3.2** SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? ☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog** SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? ☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4** **NOTE**: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? ☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^{2})

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-08 Date of site visit: 11/6/2019

Rated by A Weiss Trained by Ecology? ☑ Yes ☐ No Date of training Oct. 2020

HGM Class used for rating Riverine & Fresh Water Tidal Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).

OVERALL WETLAND CATEGORY III (based on functions ☑ or special characteristics ☐)

1. Category of wetland based on FUNCTIONS

_____ **Category I** - Total score = 23 - 27
_____ **Category II** - Total score = 20 - 22
X **Category III** - Total score = 16 - 19
_____ **Category IV** - Total score = 9 - 15

FUNCTION	Improving Water Quality	Hydrologic	Habitat	
			List appropriate rating (H, M, L)	
Site Potential	M	M	L	
Landscape Potential	H	M	L	
Value	L	M	M	**Total**
Score Based on Ratings	6	6	4	**16**

Score for each function based on three ratings
(*order of ratings is not important*)

9 = H, H, H
8 = H, H, M
7 = H, H, L
7 = H, M, M
6 = H, M, L
6 = M, M, M
5 = H, L, L
5 = M, M, L
4 = M, L, L
3 = L, L, L

2. Category based on SPECIAL CHARACTERISTICS of wetland

CHARACTERISTIC	Category
Estuarine	
Wetland of High Conservation Value	
Bog	
Mature Forest	
Old Growth Forest	
Coastal Lagoon	
Interdunal	
None of the above	X

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (*can be added to map of hydroperiods*)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (*can be added to another figure*)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3

Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

Wetland name or number WFW-08

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☑ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☑ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☑ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☑ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☑ NO - go to 7 ☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☑ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event: Depressions cover > $^3/_4$ area of wetland Depressions cover > ½ area of wetland Depressions present but cover < ½ area of wetland No depressions present	 points = 8 points = 4 points = 2 points = 0	0
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes) Trees or shrubs > $^2/_3$ area of the wetland ☑ Trees or shrubs > $^1/_3$ area of the wetland ☐ Herbaceous plants (> 6 in high) > $^2/_3$ area of the wetland Herbaceous plants (> 6 in high) > $^1/_3$ area of the wetland Trees, shrubs, and ungrazed herbaceous < $^1/_3$ area of the wetland	 points = 8 points = 6 points = 6 points = 3 points = 0	6
Total for R 1	Add the points in the boxes above	**6**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	Yes = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	Yes = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	Yes = 1 No = 0	0
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	1
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1 - R 2.4? Other Sources	Yes = 1 No = 0	0
Total for R 2	Add the points in the boxes above	**4**

Rating of Landscape Potential If score is: ☑ **3 - 6 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 No = 0	0
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	Yes = 1 No = 0	0
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	Yes = 2 No = 0	0
Total for R 3	Add the points in the boxes above	**0**

Rating of Value If score is: ☐ **2 - 4 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?		
R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).*		2
If the ratio is more than 20	points = 9	
If the ratio is 10 - 20	points = 6	
If the ratio is 5 - < 10	points = 4	
If the ratio is 1 - < 5	points = 2	
If the ratio is < 1	points = 1	
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are* *NOT Cowardin* *classes*).		7
Forest or shrub for > $^1/_3$ area OR emergent plants > $^2/_3$ area	points = 7	
Forest or shrub for > $^1/_{10}$ area OR emergent plants > $^1/_3$ area	points = 4	
Plants do not meet above criteria	points = 0	
Total for R 4	Add the points in the boxes above	**9**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?		
R 5.1. Is the stream or river adjacent to the wetland downcut?	Yes = 0 No = 1	0
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	Yes = 1 No = 0	1
R 5.3 Is the up-gradient stream or river controlled by dams?	Yes = 0 No = 1	0
Total for R 5	Add the points in the boxes above	**1**

Rating of Landscape Potential If score is: ☐ **3 = H** ☑ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?		
R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.*		1
The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
Total for R 6	Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- ☐ Aquatic bed
- ☑ Emergent
- ☑ Scrub-shrub (areas where shrubs have > 30% cover)
- ☐ Forested (areas where trees have > 30% cover)

If the unit has a Forested class, check if:

- ☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

4 structures or more: points = 4
3 structures: points = 2
2 structures: points - 1
1 structure: points = 0

1

H 1.2. Hydroperiods
Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- ☐ Permanently flooded or inundated
- ☑ Seasonally flooded or inundated
- ☐ Occasionally flooded or inundated
- ☐ Saturated only
- ☐ Permanently flowing stream or river in, or adjacent to, the wetland
- ☑ Seasonally flowing stream in, or adjacent to, the wetland
- ☐ **Lake Fringe wetland** **2 points**
- ☐ **Freshwater tidal wetland** **2 points**

4 or more types present: points = 3
3 types present: points = 2
2 types present: points = 1
1 types present: points = 0

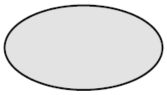
1

H 1.3. Richness of plant species
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

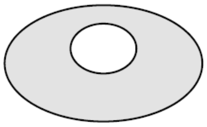
If you counted:	> 19 species	points = 2
	5 - 19 species	points = 1
	< 5 species	points = 0

1

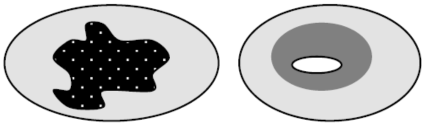
H 1.4. Interspersion of habitats
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points

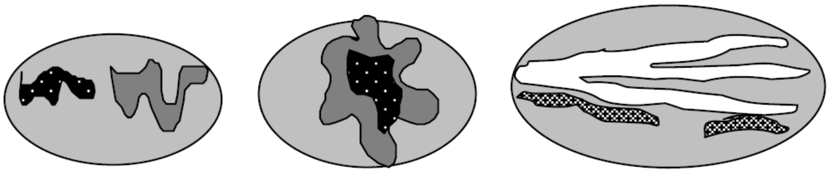


Low = 1 point



Moderate = 2 points

All three diagrams in this row are **HIGH** = 3 points



1

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☐ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☐ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	0
Total for H 1 Add the points in the boxes above	**4**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☐ **7 - 14 = M** ☑ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0 % undisturbed habitat + (0 % moderate & low intensity land uses / 2) = 0% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 15.8 % undisturbed habitat + (19.9 % moderate & low intensity land uses / 2) = 25.75% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	1

Rating of Value If Score is: ☐ **2 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE****: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☐ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type | **Category**

Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,
☐ Vegetated, and
☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☐ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina*, see page 25)
☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions***.

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-09 Date of site visit: 11/14/2019

Rated by A. Thom, S. Krueger Trained by Ecology? ☑ Yes ☐ No Date of training Oct-18

HGM Class used for rating Riverine & Fresh Water Tidal Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).
Source of base aerial photo/map ESRI / Google Earth Pro

OVERALL WETLAND CATEGORY **III** (based on functions ☑ or special characteristics ☐)

1. Category of wetland based on FUNCTIONS

____ **Category I** - Total score = 23 - 27
____ **Category II** - Total score = 20 - 22
X **Category III** - Total score = 16 - 19
____ **Category IV** - Total score = 9 - 15

FUNCTION	**Improving Water Quality**	**Hydrologic**	**Habitat**

Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☐ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☑ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for ***Riverine*** *wetlands. If it is Saltwater Tidal Fringe it is an* ***Estuarine*** *wetland and is not scored. This method* ***cannot*** *be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
If your wetland can be classified as a Flats wetland, use the form for ***Depressional*** *wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☑ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☑ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☑ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7 ☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event:		0
Depressions cover > $^3/_4$ area of wetland	points = 8	
Depressions cover > ½ area of wetland	points = 4	
Depressions present but cover < ½ area of wetland	points = 2	
No depressions present	points = 0	
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes)		8
Trees or shrubs > $^2/_3$ area of the wetland	points = 8	
☐ Trees or shrubs > $^1/_3$ area of the wetland	points = 6	
☐ Herbaceous plants (> 6 in high) > $^2/_3$ area of the wetland	points = 6	
Herbaceous plants (> 6 in high) > $^1/_3$ area of the wetland	points = 3	
Trees, shrubs, and ungrazed herbaceous < $^1/_3$ area of the wetland	points = 0	
Total for R 1	Add the points in the boxes above	**8**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	Yes = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	Yes = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	Yes = 1 No = 0	0
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	1
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1 - R 2.4? Other Sources	Yes = 1 No = 0	0
Total for R 2	Add the points in the boxes above	**4**

Rating of Landscape Potential If score is: ☑ **3 - 6 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 No = 0	0
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	Yes = 1 No = 0	0
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	Yes = 2 No = 0	0
Total for R 3	Add the points in the boxes above	**0**

Rating of Value If score is: ☐ **2 - 4 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?		
R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).* If the ratio is more than 20 If the ratio is 10 - 20 If the ratio is 5 - < 10 If the ratio is 1 - < 5 If the ratio is < 1	points = 9 points = 6 points = 4 points = 2 points = 1	2
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are NOT Cowardin classes).* Forest or shrub for > $^1/_3$ area OR emergent plants > $^2/_3$ area Forest or shrub for > $^1/_{10}$ area OR emergent plants > $^1/_3$ area Plants do not meet above criteria	points = 7 points = 4 points = 0	7
Total for R 4	Add the points in the boxes above	**9**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?			
R 5.1. Is the stream or river adjacent to the wetland downcut?	Yes = 0	No = 1	1
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	Yes = 1	No = 0	1
R 5.3 Is the up-gradient stream or river controlled by dams?	Yes = 0	No = 1	1
Total for R 5		Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?		
R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.* The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds) Surface flooding problems are in a sub-basin farther down-gradient No flooding problems anywhere downstream	points = 2 points = 1 points = 0	1
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
Total for R 6	Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- ☐ Aquatic bed
- ☐ Emergent
- ☑ Scrub-shrub (areas where shrubs have > 30% cover)
- ☐ Forested (areas where trees have > 30% cover)

If the unit has a Forested class, check if:

- ☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

4 structures or more: points = 4
3 structures: points = 2
2 structures: points - 1
1 structure: points = 0

0

H 1.2. Hydroperiods
Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- ☐ Permanently flooded or inundated
- ☑ Seasonally flooded or inundated
- ☐ Occasionally flooded or inundated
- ☐ Saturated only
- ☐ Permanently flowing stream or river in, or adjacent to, the wetland
- ☑ Seasonally flowing stream in, or adjacent to, the wetland
- ☐ **Lake Fringe wetland** **2 points**
- ☐ **Freshwater tidal wetland** **2 points**

4 or more types present: points = 3
3 types present: points = 2
2 types present: points = 1
1 types present: points = 0

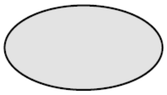
1

H 1.3. Richness of plant species
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

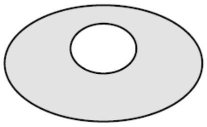
If you counted:	> 19 species	points = 2
	5 - 19 species	points = 1
	< 5 species	points = 0

0

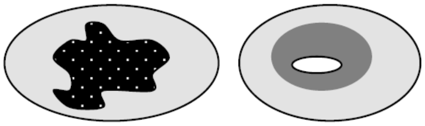
H 1.4. Interspersion of habitats
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points

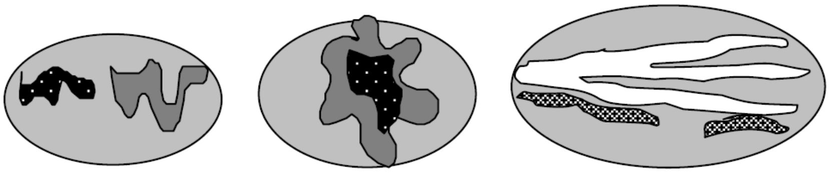


Low = 1 point



Moderate = 2 points

All three diagrams in this row are **HIGH** = 3 points



0

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☐ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☐ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☑ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	1
Total for H 1 Add the points in the boxes above	**2**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☐ **7 - 14 = M** ☑ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0.3 % undisturbed habitat + (0 % moderate & low intensity land uses / 2) = 0.3% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 17.5 % undisturbed habitat + (21 % moderate & low intensity land uses / 2) = 28% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	1

Rating of Value If Score is: ☐ **2 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE**: This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type *Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.*	Category
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? ☐ The dominant water regime is tidal, ☐ Vegetated, and ☐ With a salinity greater than 0.5 ppt ☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? ☐ Yes = **Category I** ☐ No - Go to **SC 1.2**	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25) ☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. ☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. ☐ Yes = **Category I** ☐ No = **Category II**	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? ☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3** SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? ☐ Yes = **Category I** ☑ No = **Not WHCV** SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf ☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV** SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? ☐ Yes = **Category I** ☐ No = **Not WHCV**	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions*** *.* SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? ☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2** SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? ☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog** SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? ☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4** **NOTE**: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? ☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-10 Date of site visit: 11/1/2019

Rated by A. Hoenig, A. Thom Trained by Ecology? ☑ Yes ☐ No Date of training Oct-15

HGM Class used for rating Riverine & Fresh Water Tidal Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).

Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for ***Riverine*** *wetlands. If it is Saltwater Tidal Fringe it is an* ***Estuarine*** *wetland and is not scored. This method* ***cannot*** *be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
If your wetland can be classified as a Flats wetland, use the form for ***Depressional*** *wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☑ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☑ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☑ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☑ NO - go to 7 ☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☑ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:
R3.3, R6.1, R6.2:
Schwartz, M., Salibury, N., Brosseau, W., Bui, P., and Anderson, R. 2016. Hylebos Watershed Plan. Prepared by Earth Corps. July 2016.

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event:		2
Depressions cover > $^3/_4$ area of wetland	points = 8	
Depressions cover > ½ area of wetland	points = 4	
Depressions present but cover < ½ area of wetland	points = 2	
No depressions present	points = 0	
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes)		8
Trees or shrubs > $^2/_3$ area of the wetland	points = 8	
☑ Trees or shrubs > $^1/_3$ area of the wetland	points = 6	
☐ Herbaceous plants (> 6 in high) > $^2/_3$ area of the wetland	points = 6	
Herbaceous plants (> 6 in high) > $^1/_3$ area of the wetland	points = 3	
Trees, shrubs, and ungrazed herbaceous < $^1/_3$ area of the wetland	points = 0	
Total for R 1	Add the points in the boxes above	**10**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	Yes = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	Yes = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	Yes = 1 No = 0	0
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	1
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1 - R 2.4? Other Sources trash	Yes = 1 No = 0	1
Total for R 2	Add the points in the boxes above	**5**

Rating of Landscape Potential If score is: ☑ **3 - 6 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 No = 0	0
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	Yes = 1 No = 0	0
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	Yes = 2 No = 0	0
Total for R 3	Add the points in the boxes above	**0**

Rating of Value If score is: ☐ **2 - 4 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?		
R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).*		2
If the ratio is more than 20	points = 9	
If the ratio is 10 - 20	points = 6	
If the ratio is 5 - < 10	points = 4	
If the ratio is 1 - < 5	points = 2	
If the ratio is < 1	points = 1	
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are* *NOT Cowardin* *classes*).		7
Forest or shrub for > $^{1}/_{3}$ area OR emergent plants > $^{2}/_{3}$ area	points = 7	
Forest or shrub for > $^{1}/_{10}$ area OR emergent plants > $^{1}/_{3}$ area	points = 4	
Plants do not meet above criteria	points = 0	
Total for R 4	Add the points in the boxes above	**9**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?			
R 5.1. Is the stream or river adjacent to the wetland downcut?	Yes = 0	No = 1	1
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	Yes = 1	No = 0	1
R 5.3 Is the up-gradient stream or river controlled by dams?	Yes = 0	No = 1	1
Total for R 5	Add the points in the boxes above		**3**

Rating of Landscape Potential If score is: ☑ **3 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?		
R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.*		1
The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
Total for R 6	Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

☐ Aquatic bed
☐ Emergent
☐ Scrub-shrub (areas where shrubs have > 30% cover)
☑ Forested (areas where trees have > 30% cover)
If the unit has a Forested class, check if:
☑ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

4 structures or more: points = 4
3 structures: points = 2
2 structures: points - 1
1 structure: points = 0

1

H 1.2. Hydroperiods
Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

☐ Permanently flooded or inundated
☐ Seasonally flooded or inundated
☑ Occasionally flooded or inundated
☑ Saturated only
☐ Permanently flowing stream or river in, or adjacent to, the wetland
☑ Seasonally flowing stream in, or adjacent to, the wetland
☐ **Lake Fringe wetland** **2 points**
☐ **Freshwater tidal wetland** **2 points**

4 or more types present: points = 3
3 types present: points = 2
2 types present: points = 1
1 types present: points = 0

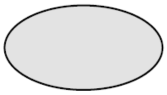
2

H 1.3. Richness of plant species
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

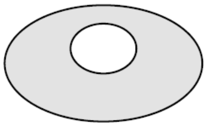
If you counted:
> 19 species points = 2
5 - 19 species points = 1
< 5 species points = 0

1

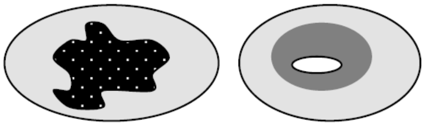
H 1.4. Interspersion of habitats
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



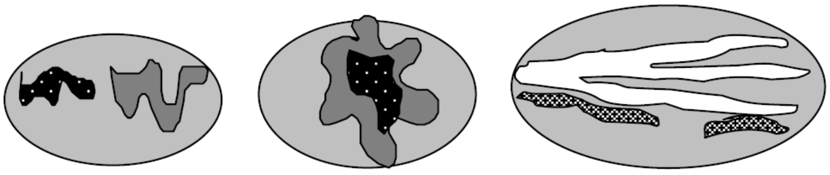
None = 0 points



Low = 1 point



Moderate = 2 points



All three diagrams in this row are **HIGH** = 3 points

2

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☑ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☑ Standing snags (dbh > 4 in) within the wetland ☑ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	3
Total for H 1 Add the points in the boxes above	**9**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☑ **7 - 14 = M** ☐ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0.3 % undisturbed habitat + (3.3 % moderate & low intensity land uses / 2) = 1.95% If total accessible habitat is: > $^{1}/_{3}$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 21.4 % undisturbed habitat + (19.7 % moderate & low intensity land uses / 2) = 31.25% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	1

Rating of Value If Score is: ☐ **2 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE****: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type | **Category**

Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,
☐ Vegetated, and
☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☐ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25)
☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions*** *.*

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^{2})

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-11 Date of site visit: 11/1/2019

Rated by A. Hoenig, A. Thom Trained by Ecology? ☑ Yes ☐ No Date of training Oct. 2015

HGM Class used for rating Depressional & Flats Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).
Source of base aerial photo/map ESRI / Google Earth Pro

OVERALL WETLAND CATEGORY III (based on functions ☑ or special characteristics ☐)

1. Category of wetland based on FUNCTIONS

____ **Category I** - Total score = 23 - 27
____ **Category II** - Total score = 20 - 22
X **Category III** - Total score = 16 - 19
____ **Category IV** - Total score = 9 - 15

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (*can be added to map of hydroperiods*)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (*can be added to another figure*)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	L 3.1, L 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	L 3.3	

Slope Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Plant cover of **dense** trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of **dense, rigid** trees, shrubs, and herbaceous plants (*can be added to another figure*)	S 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

☑ NO - go to 6 ☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7 ☑ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:
A portion of the wetland is riverine and a portion is depressional. Depressional + Riverine along stream within boundary of depression, therefore the HGM class used for this rating is Depressional.

DEPRESSIONAL AND FLATS WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

D 1.0. Does the site have the potential to improve water quality?	
D 1.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet). points = 3 Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet. points = 2 ☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing points = 1 ☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch. points = 1	2
D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (*use NRCS definitions*). Yes = 4 No = 0	0
D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes): Wetland has persistent, ungrazed, plants > 95% of area points = 5 Wetland has persistent, ungrazed, plants > ½ of area points = 3 Wetland has persistent, ungrazed plants > $^{1}/_{10}$ of area points = 1 Wetland has persistent, ungrazed plants < $^{1}/_{10}$ of area points = 0	5
D 1.4. Characteristics of seasonal ponding or inundation: *This is the area that is ponded for at least 2 months. See description in manual.* Area seasonally ponded is > ½ total area of wetland points = 4 Area seasonally ponded is > ¼ total area of wetland points = 2 Area seasonally ponded is < ¼ total area of wetland points = 0	2
Total for D 1 Add the points in the boxes above	**9**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

D 2.0. Does the landscape have the potential to support the water quality function of the site?	
D 2.1. Does the wetland unit receive stormwater discharges? Yes = 1 No = 0	0
D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants? Yes = 1 No = 0	1
D 2.3. Are there septic systems within 250 ft of the wetland? Yes = 1 No = 0	0
D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3? Source Yes = 1 No = 0	0
Total for D 2 Add the points in the boxes above	**1**

Rating of Landscape Potential If score is: ☐ **3 or 4 = H** ☑ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

D 3.0. Is the water quality improvement provided by the site valuable to society?	
D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list? Yes = 1 No = 0	0
D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list? Yes = 1 No = 0	1
D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (*answer YES if there is a TMDL for the basin in which the unit is found*)? Yes = 2 No = 0	0
Total for D 3 Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

DEPRESSIONAL AND FLATS WETLANDS

Hydrologic Functions - Indicators that the site functions to reduce flooding and stream degradation

D 4.0. Does the site have the potential to reduce flooding and erosion?	
D 4.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression with no surface water leaving it (no outlet) points = 4 Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet points = 2 Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch points = 1 Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing points = 0	2
D 4.2. Depth of storage during wet periods: *Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.* Marks of ponding are 3 ft or more above the surface or bottom of outlet points = 7 Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet points = 5 ☑ Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet points = 3 ☐ The wetland is a "headwater" wetland points = 3 Wetland is flat but has small depressions on the surface that trap water points = 1 Marks of ponding less than 0.5 ft (6 in) points = 0	3
D 4.3. Contribution of the wetland to storage in the watershed: *Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.* ☐ The area of the basin is less than 10 times the area of the unit points = 5 The area of the basin is 10 to 100 times the area of the unit points = 3 The area of the basin is more than 100 times the area of the unit points = 0 ☐ Entire wetland is in the Flats class points = 5	3
Total for D 4 Add the points in the boxes above	**8**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

D 5.0. Does the landscape have the potential to support hydrologic function of the site?	
D 5.1. Does the wetland unit receive stormwater discharges? Yes = 1 No = 0	0
D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff? Yes = 1 No = 0	1
D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)? Yes = 1 No = 0	1
Total for D 5 Add the points in the boxes above	**2**

Rating of Landscape Potential If score is: ☐ **3 = H** ☑ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

D 6.0. Are the hydrologic functions provided by the site valuable to society?	
D 6.1. The unit is in a landscape that has flooding problems. *Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.* The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds): ● Flooding occurs in a sub-basin that is immediately down-gradient of unit. points = 2 ☑ ● Surface flooding problems are in a sub-basin farther down-gradient. points = 1 ☐ Flooding from groundwater is an issue in the sub-basin. points = 1 ☐ The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why points = 0 ☐ There are no problems with flooding downstream of the wetland. points = 0	1
D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0	0
Total for D 6 Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

☐ Aquatic bed	4 structures or more: points = 4
☑ Emergent	3 structures: points = 2
☐ Scrub-shrub (areas where shrubs have > 30% cover)	2 structures: points - 1
☑ Forested (areas where trees have > 30% cover)	1 structure: points = 0

If the unit has a Forested class, check if :

☑ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

2

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

☐ Permanently flooded or inundated	4 or more types present: points = 3
☑ Seasonally flooded or inundated	3 types present: points = 2
☐ Occasionally flooded or inundated	2 types present: points = 1
☑ Saturated only	1 types present: points = 0
☐ Permanently flowing stream or river in, or adjacent to, the wetland	
☐ Seasonally flowing stream in, or adjacent to, the wetland	
☐ **Lake Fringe wetland**	**2 points**
☐ **Freshwater tidal wetland**	**2 points**

1

H 1.3. Richness of plant species

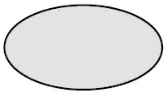
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

If you counted:	> 19 species	points = 2
	5 - 19 species	points = 1
	< 5 species	points = 0

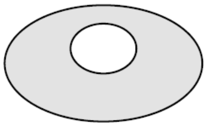
1

H 1.4. Interspersion of habitats

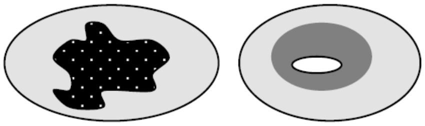
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points



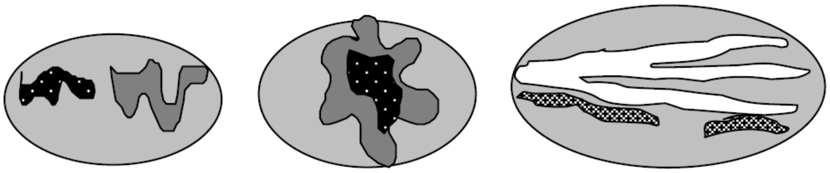
Low = 1 point



Moderate = 2 points

1

All three diagrams in this row are **HIGH** = 3 points



H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☑ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☑ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	2
Total for H 1 Add the points in the boxes above	**7**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☑ **7 - 14 = M** ☐ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0 % undisturbed habitat + (13.2 % moderate & low intensity land uses / 2) = 6.6% If total accessible habitat is: > $^{1}/_{3}$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 23.7 % undisturbed habitat + (21.2 % moderate & low intensity land uses / 2) = 34.3% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	1

Rating of Value If Score is: ☐ **2 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE***: *This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type *Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.*	**Category**
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? ☐ The dominant water regime is tidal, ☐ Vegetated, and ☐ With a salinity greater than 0.5 ppt ☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? ☐ Yes = **Category I** ☐ No - Go to **SC 1.2**	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25) ☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. ☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. ☐ Yes = **Category I** ☐ No = **Category II**	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? ☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3** SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? ☐ Yes = **Category I** ☑ No = **Not WHCV** SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf ☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV** SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? ☐ Yes = **Category I** ☐ No = **Not WHCV**	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below. **If you answer YES you will still need to rate the wetland based on its functions**.* SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? ☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2** SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? ☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog** SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? ☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4** **NOTE**: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? ☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^1/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-12 Date of site visit: 11/14/2019

Rated by A. Thom Trained by Ecology? ☑ Yes ☐ No Date of training Oct. 2018

HGM Class used for rating Riverine & Fresh Water Tidal Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).

Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for ***Riverine*** *wetlands. If it is Saltwater Tidal Fringe it is an* ***Estuarine*** *wetland and is not scored. This method* ***cannot*** *be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
If your wetland can be classified as a Flats wetland, use the form for ***Depressional*** *wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☑ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☑ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☑ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7 ☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event:		2
Depressions cover > $^{3}/_{4}$ area of wetland	points = 8	
Depressions cover > ½ area of wetland	points = 4	
Depressions present but cover < ½ area of wetland	points = 2	
No depressions present	points = 0	
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes)		8
Trees or shrubs > $^{2}/_{3}$ area of the wetland	points = 8	
☐ Trees or shrubs > $^{1}/_{3}$ area of the wetland	points = 6	
☐ Herbaceous plants (> 6 in high) > $^{2}/_{3}$ area of the wetland	points = 6	
Herbaceous plants (> 6 in high) > $^{1}/_{3}$ area of the wetland	points = 3	
Trees, shrubs, and ungrazed herbaceous < $^{1}/_{3}$ area of the wetland	points = 0	
Total for R 1	Add the points in the boxes above	**10**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	Yes = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	Yes = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	Yes = 1 No = 0	0
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	1
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1 - R 2.4? Other Sources lots of trash	Yes = 1 No = 0	1
Total for R 2	Add the points in the boxes above	**5**

Rating of Landscape Potential If score is: ☑ **3 - 6 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 No = 0	0
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	Yes = 1 No = 0	0
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	Yes = 2 No = 0	0
Total for R 3	Add the points in the boxes above	**0**

Rating of Value If score is: ☐ **2 - 4 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?		
R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).*		2
If the ratio is more than 20	points = 9	
If the ratio is 10 - 20	points = 6	
If the ratio is 5 - < 10	points = 4	
If the ratio is 1 - < 5	points = 2	
If the ratio is < 1	points = 1	
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are NOT Cowardin classes).*		7
Forest or shrub for > $^{1}/_{3}$ area OR emergent plants > $^{2}/_{3}$ area	points = 7	
Forest or shrub for > $^{1}/_{10}$ area OR emergent plants > $^{1}/_{3}$ area	points = 4	
Plants do not meet above criteria	points = 0	
Total for R 4	Add the points in the boxes above	**9**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?			
R 5.1. Is the stream or river adjacent to the wetland downcut?	Yes = 0	No = 1	1
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	Yes = 1	No = 0	1
R 5.3 Is the up-gradient stream or river controlled by dams?	Yes = 0	No = 1	1
Total for R 5	Add the points in the boxes above		**3**

Rating of Landscape Potential If score is: ☑ **3 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?		
R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.*		1
The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
Total for R 6	Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- ☐ Aquatic bed
- ☑ Emergent
- ☑ Scrub-shrub (areas where shrubs have > 30% cover)
- ☑ Forested (areas where trees have > 30% cover)

If the unit has a Forested class, check if:

- ☑ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

4 structures or more: points = 4
3 structures: points = 2
2 structures: points - 1
1 structure: points = 0

4

H 1.2. Hydroperiods
Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- ☐ Permanently flooded or inundated
- ☑ Seasonally flooded or inundated
- ☐ Occasionally flooded or inundated
- ☑ Saturated only
- ☐ Permanently flowing stream or river in, or adjacent to, the wetland
- ☑ Seasonally flowing stream in, or adjacent to, the wetland
- ☐ **Lake Fringe wetland** **2 points**
- ☐ **Freshwater tidal wetland** **2 points**

4 or more types present: points = 3
3 types present: points = 2
2 types present: points = 1
1 types present: points = 0

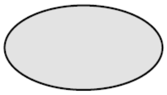
2

H 1.3. Richness of plant species
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

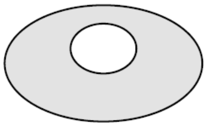
If you counted:		
	> 19 species	points = 2
	5 - 19 species	points = 1
	< 5 species	points = 0

1

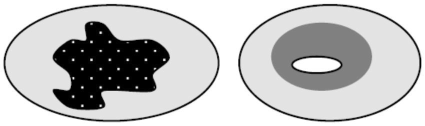
H 1.4. Interspersion of habitats
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points



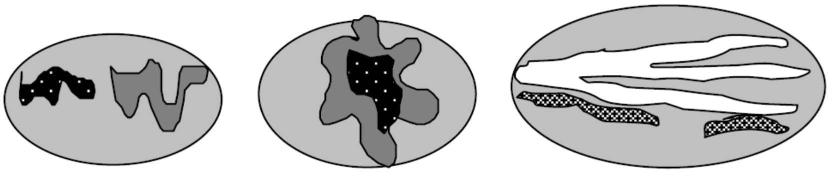
Low = 1 point



Moderate = 2 points

2

All three diagrams in this row are **HIGH** = 3 points



H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☑ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☑ Standing snags (dbh > 4 in) within the wetland ☑ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	3
Total for H 1 Add the points in the boxes above	**12**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☑ **7 - 14 = M** ☐ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0.3 % undisturbed habitat + (0 % moderate & low intensity land uses / 2) = 0.3% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 19.6 % undisturbed habitat + (20.6 % moderate & low intensity land uses / 2) = 29.9% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	1

Rating of Value If Score is: ☐ **2 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE**: This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

Wetland name or number WFW-12

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type | **Category**

Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,
☐ Vegetated, and
☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☐ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina*, see page 25)
☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions***.

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-13 Date of site visit: 11/26/2019

Rated by A. Hoenig, M. Murphy, A. Thor Trained by Ecology? ☑ Yes ☐ No Date of training 15-Oct

HGM Class used for rating Slope Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).
Source of base aerial photo/map ESRI / Google Earth Pro

OVERALL WETLAND CATEGORY IV (based on functions ☑ or special characteristics ☐)

1. Category of wetland based on FUNCTIONS

_____ **Category I** - Total score = 23 - 27
_____ **Category II** - Total score = 20 - 22
_____ **Category III** - Total score = 16 - 19
X **Category IV** - Total score = 9 - 15

FUNCTION	**Improving Water Quality**	**Hydrologic**	**Habitat**	
	List appropriate rating (H, M, L)			
Site Potential	L	L	L	
Landscape Potential	M	M	L	
Value	M	M	L	**Total**
Score Based on Ratings	5	5	3	**13**

Score for each function based on three ratings (*order of ratings is not important*)

9 = H, H, H
8 = H, H, M
7 = H, H, L
7 = H, M, M
6 = H, M, L
6 = M, M, M
5 = H, L, L
5 = M, M, L
4 = M, L, L
3 = L, L, L

2. Category based on SPECIAL CHARACTERISTICS of wetland

CHARACTERISTIC	**Category**
Estuarine	
Wetland of High Conservation Value	
Bog	
Mature Forest	
Old Growth Forest	
Coastal Lagoon	
Interdunal	
None of the above	**X**

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (*can be added to map of hydroperiods*)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (*can be added to another figure*)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	L 3.1, L 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	L 3.3	

Slope Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Plant cover of **dense** trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of **dense, rigid** trees, shrubs, and herbaceous plants (*can be added to another figure*)	S 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

Wetland name or number WFW-13

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☑ The wetland is on a slope (*slope can be very gradual*),
☑ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☑ The water leaves the wetland **without being impounded.**

☐ NO - go to 5 ☑ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7 ☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

SLOPE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

S 1.0. Does the site have the potential to improve water quality?	
S 1.1. Characteristics of the average slope of the wetland: (*a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance*) Slope is 1% or less points = 3 Slope is > 1% - 2% points = 2 Slope is > 2% - 5% points = 1 Slope is greater than 5% points = 0	1
S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (*use NRCS definitions*): Yes = 3 No = 0	0
S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants: Choose the points appropriate for the description that best fits the plants in the wetland. *Dense means you have trouble seeing the soil surface (>75% cover), and uncut means not grazed or mowed and plants are higher than 6 in.* Dense, uncut, herbaceous plants > 90% of the wetland area points = 6 Dense, uncut, herbaceous plants > ½ of area points = 3 Dense, woody, plants > ½ of area points = 2 Dense, uncut, herbaceous plants > ¼ of area points = 1 Does not meet any of the criteria above for plants points = 0	0
Total for S 1 Add the points in the boxes above	**1**

Rating of Site Potential If score is: ☐ **12 = H** ☐ **6 - 11 = M** ☑ **0 - 5 = L** *Record the rating on the first page*

S 2.0. Does the landscape have the potential to support the water quality function of the site?	
S 2.1. Is > 10% of the area within 150 ft on the uphill side of the wetland in land uses that generate pollutants? Yes = 1 No = 0	1
S 2.2. Are there other sources of pollutants coming into the wetland that are not listed in question S 2.1? Other Sources Yes = 1 No = 0	0
Total for S 2 Add the points in the boxes above	**1**

Rating of Landscape Potential If score is: ☑ **1 - 2 = M** ☐ **0 = L** *Record the rating on the first page*

S 3.0. Is the water quality improvement provided by the site valuable to society?	
S 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list? Yes = 1 No = 0	0
S 3.2. Is the wetland in a basin or sub-basin where water quality is an issue? *At least one aquatic resource in the basin is on the 303(d) list.* Yes = 1 No = 0	1
S 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? A*nswer YES if there is a TMDL for the basin in which the unit is found*? Yes = 2 No = 0	0
Total for S 3 Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

SLOPE WETLANDS

Hydrologic Functions - Indicators that the site functions to reduce flooding and stream erosion

S 4.0. Does the site have the potential to reduce flooding and stream erosion?	
S 4.1. Characteristics of plants that reduce the velocity of surface flows during storms: Choose the points appropriate for the description that best fits conditions in the wetland. *Stems of plants should be thick enough (usually > $^1/_8$ in), or dense enough, to remain erect during surface flows.* Dense, uncut, **rigid** plants cover > 90% of the area of the wetland points = 1 All other conditions points = 0	0

Rating of Site Potential If score is: ☐**1 = M** ☑**0 = L** *Record the rating on the first page*

S 5.0. Does the landscape have the potential to support hydrologic functions of the site?	
S 5.1. Is more than 25% of the area within 150 ft upslope of wetland in land uses or cover that generate excess surface runoff? Yes = 1 No = 0	1

Rating of Landscape Potential If score is: ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

S 6.0. Are the hydrologic functions provided by the site valuable to society?	
S 6.1. Distance to the nearest areas downstream that have flooding problems: The sub-basin immediately down-gradient of site has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds) points = 2 Surface flooding problems are in a sub-basin farther down-gradient points = 1 No flooding problems anywhere downstream points = 0	1
S 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0	0
Total for S 6 Add the points in the boxes above	**1**

Rating of Value If score is: ☐**2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

NOTES and FIELD OBSERVATIONS:

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

☐ Aquatic bed	4 structures or more: points = 4	0
☐ Emergent	3 structures: points = 2	
☑ Scrub-shrub (areas where shrubs have > 30% cover)	2 structures: points - 1	
☐ Forested (areas where trees have > 30% cover)	1 structure: points = 0	

If the unit has a Forested class, check if:

☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

H 1.2. Hydroperiods
Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

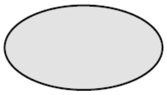
☐ Permanently flooded or inundated	4 or more types present: points = 3	
☐ Seasonally flooded or inundated	3 types present: points = 2	0
☐ Occasionally flooded or inundated	2 types present: points = 1	
☑ Saturated only	1 types present: points = 0	
☐ Permanently flowing stream or river in, or adjacent to, the wetland		
☐ Seasonally flowing stream in, or adjacent to, the wetland		
☐ **Lake Fringe wetland**	**2 points**	
☐ **Freshwater tidal wetland**	**2 points**	

H 1.3. Richness of plant species
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

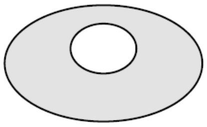
0

If you counted:	> 19 species	points = 2
	5 - 19 species	points = 1
	< 5 species	points = 0

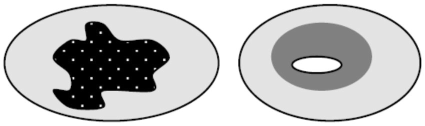
H 1.4. Interspersion of habitats
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points



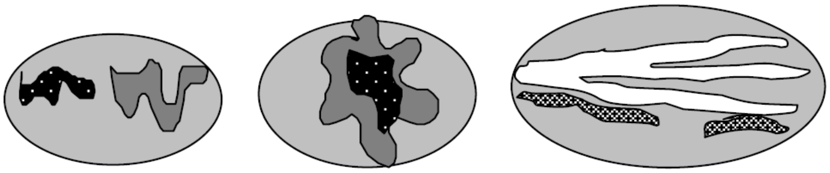
Low = 1 point



Moderate = 2 points

0

All three diagrams in this row are **HIGH** = 3 points



H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☐ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☐ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	0
Total for H 1 — Add the points in the boxes above	**0**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☐ **7 - 14 = M** ☑ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0 % undisturbed habitat + (1.6 % moderate & low intensity land uses / 2) = 0.8% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon — points = 3 20 - 33% of 1 km Polygon — points = 2 10 - 19% of 1 km Polygon — points = 1 < 10 % of 1 km Polygon — points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 24.4 % undisturbed habitat + (22 % moderate & low intensity land uses / 2) = 35.4% Undisturbed habitat > 50% of Polygon — points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches — points = 2 Undisturbed habitat 10 - 50% and > 3 patches — points = 1 Undisturbed habitat < 10% of 1 km Polygon — points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use — points = (-2) ≤ 50% of 1km Polygon is high intensity — points = 0	-2
Total for H 2 — Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: — points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m — points = 1 Site does not meet any of the criteria above — points = 0	0

Rating of Value If Score is: ☐ **2 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE****: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☐ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☐ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

Wetland name or number WFW-13

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type | **Category**

Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,
☐ Vegetated, and
☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☐ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☐ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina*, see page 25)
☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☐ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions***.

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☐ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☐ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☐ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☐ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☐ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-14 Date of site visit: 12/3/2019

Rated by T. Parry, A. Thom Trained by Ecology? ☑ Yes ☐ No Date of training Oct-18

HGM Class used for rating Depressional & Flats Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for ***Riverine*** *wetlands. If it is Saltwater Tidal Fringe it is an* ***Estuarine*** *wetland and is not scored. This method* ***cannot*** *be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
If your wetland can be classified as a Flats wetland, use the form for ***Depressional*** *wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☐ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

☑ NO - go to 6 ☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7 ☑ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:
A portion of the wetland is riverine and a portion is depressional. Depressional + Riverine along stream within boundary of depression, therefore the HGM class used for this rating is Depressional.

DEPRESSIONAL AND FLATS WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

D 1.0. Does the site have the potential to improve water quality?		
D 1.1. Characteristics of surface water outflows from the wetland:		2
Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet).	points = 3	
Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet.	points = 2	
☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing	points = 1	
☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch.	points = 1	
D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (*use NRCS definitions*).	Yes = 4 No = 0	0
D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes):		0
Wetland has persistent, ungrazed, plants > 95% of area	points = 5	
Wetland has persistent, ungrazed, plants > ½ of area	points = 3	
Wetland has persistent, ungrazed plants > $^{1}/_{10}$ of area	points = 1	
Wetland has persistent, ungrazed plants < $^{1}/_{10}$ of area	points = 0	
D 1.4. Characteristics of seasonal ponding or inundation: *This is the area that is ponded for at least 2 months. See description in manual.*		0
Area seasonally ponded is > ½ total area of wetland	points = 4	
Area seasonally ponded is > ¼ total area of wetland	points = 2	
Area seasonally ponded is < ¼ total area of wetland	points = 0	
Total for D 1	Add the points in the boxes above	**2**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☐ **6 - 11 = M** ☑ **0 - 5 = L** *Record the rating on the first page*

D 2.0. Does the landscape have the potential to support the water quality function of the site?		
D 2.1. Does the wetland unit receive stormwater discharges?	Yes = 1 No = 0	1
D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	1
D 2.3. Are there septic systems within 250 ft of the wetland?	Yes = 1 No = 0	0
D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3? Source	Yes = 1 No = 0	0
Total for D 2	Add the points in the boxes above	**2**

Rating of Landscape Potential If score is: ☐ **3 or 4 = H** ☑ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

D 3.0. Is the water quality improvement provided by the site valuable to society?		
D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?	Yes = 1 No = 0	0
D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list?	Yes = 1 No = 0	1
D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (*answer YES if there is a TMDL for the basin in which the unit is found*)?	Yes = 2 No = 0	0
Total for D 3	Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

DEPRESSIONAL AND FLATS WETLANDS

Hydrologic Functions - Indicators that the site functions to reduce flooding and stream degradation

D 4.0. Does the site have the potential to reduce flooding and erosion?	
D 4.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression with no surface water leaving it (no outlet) points = 4 Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet points = 2 Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch points = 1 Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing points = 0	2
D 4.2. Depth of storage during wet periods: *Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.* Marks of ponding are 3 ft or more above the surface or bottom of outlet points = 7 Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet points = 5 ☐ Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet points = 3 ☐ The wetland is a "headwater" wetland points = 3 Wetland is flat but has small depressions on the surface that trap water points = 1 Marks of ponding less than 0.5 ft (6 in) points = 0	0
D 4.3. Contribution of the wetland to storage in the watershed: *Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.* ☐ The area of the basin is less than 10 times the area of the unit points = 5 The area of the basin is 10 to 100 times the area of the unit points = 3 The area of the basin is more than 100 times the area of the unit points = 0 ☐ Entire wetland is in the Flats class points = 5	0
Total for D 4 Add the points in the boxes above	**2**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☐ **6 - 11 = M** ☑ **0 - 5 = L** *Record the rating on the first page*

D 5.0. Does the landscape have the potential to support hydrologic function of the site?	
D 5.1. Does the wetland unit receive stormwater discharges? Yes = 1 No = 0	1
D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff? Yes = 1 No = 0	1
D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)? Yes = 1 No = 0	1
Total for D 5 Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

D 6.0. Are the hydrologic functions provided by the site valuable to society?	
D 6.1. The unit is in a landscape that has flooding problems. *Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.* The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds): ● Flooding occurs in a sub-basin that is immediately down-gradient of unit. points = 2 ☑ ● Surface flooding problems are in a sub-basin farther down-gradient. points = 1 ☐ Flooding from groundwater is an issue in the sub-basin. points = 1 ☐ The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why points = 0 ☐ There are no problems with flooding downstream of the wetland. points = 0	1
D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0	0
Total for D 6 Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.* ☐ Aquatic bed — 4 structures or more: points = 4 ☑ Emergent — 3 structures: points = 2 ☐ Scrub-shrub (areas where shrubs have > 30% cover) — 2 structures: points - 1 ☐ Forested (areas where trees have > 30% cover) — 1 structure: points = 0 *If the unit has a Forested class, check if*: ☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon	0
H 1.2. Hydroperiods Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*). ☐ Permanently flooded or inundated — 4 or more types present: points = 3 ☐ Seasonally flooded or inundated — 3 types present: points = 2 ☐ Occasionally flooded or inundated — 2 types present: points = 1 ☑ Saturated only — 1 types present: points = 0 ☐ Permanently flowing stream or river in, or adjacent to, the wetland ☐ Seasonally flowing stream in, or adjacent to, the wetland ☐ **Lake Fringe wetland** — **2 points** ☐ **Freshwater tidal wetland** — **2 points**	0
H 1.3. Richness of plant species Count the number of plant species in the wetland that cover at least 10 ft^2. *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species.* ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle*** If you counted: > 19 species — points = 2 5 - 19 species — points = 1 < 5 species — points = 0	0
H 1.4. Interspersion of habitats Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*  **None** = 0 points  **Low** = 1 point  **Moderate** = 2 points All three diagrams in this row are **HIGH** = 3 points 	0

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☐ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☐ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☑ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	1
Total for H 1 — Add the points in the boxes above	**1**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☐ **7 - 14 = M** ☑ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0 % undisturbed habitat + (1.1 % moderate & low intensity land uses / 2) = 0.55% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon — points = 3 20 - 33% of 1 km Polygon — points = 2 10 - 19% of 1 km Polygon — points = 1 < 10 % of 1 km Polygon — points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 25.2 % undisturbed habitat + (21.4 % moderate & low intensity land uses / 2) = 35.9% Undisturbed habitat > 50% of Polygon — points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches — points = 2 Undisturbed habitat 10 - 50% and > 3 patches — points = 1 Undisturbed habitat < 10% of 1 km Polygon — points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use — points = (-2) ≤ 50% of 1km Polygon is high intensity — points = 0	-2
Total for H 2 — Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: — points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m — points = 1 Site does not meet any of the criteria above — points = 0	1

Rating of Value If Score is: ☐ **2 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE****: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type **Category**

Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,
☐ Vegetated, and
☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☐ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25)
☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions*** *.*

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**

SC 4.0. Forested Wetlands Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.*** ☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more. ☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm). ☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**	
SC 5.0. Wetlands in Coastal Lagoons Does the wetland meet all of the following criteria of a wetland in a coastal lagoon? ☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks ☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*) ☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon** SC 5.1. Does the wetland meet all of the following three conditions? ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100). ☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. ☐ The wetland is larger than $^1/_{10}$ ac (4350 ft^2) ☐ Yes = **Category I** ☐ No = **Category II**	
SC 6.0. Interdunal Wetlands Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.*** In practical terms that means the following geographic areas: ☐ Long Beach Peninsula: Lands west of SR 103 ☐ Grayland-Westport: Lands west of SR 105 ☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109 ☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating** SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)? ☐ Yes = **Category I** ☐ No - Go to **SC 6.2** SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger? ☐ Yes = **Category II** ☐ No - Go to **SC 6.3** SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac? ☐ Yes = **Category III** ☐ No = **Category IV**	
Category of wetland based on Special Characteristics If you answered No for all types, enter "Not Applicable" on Summary Form	

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-15 Date of site visit: 4/20/2023

Rated by Kaylee Moser and A. Thom Trained by Ecology? ☑ Yes ☐ No Date of training Oct. 2018

HGM Class used for rating Riverine & Fresh Water Tidal Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).
Source of base aerial photo/map ESRI / Google Earth Pro

OVERALL WETLAND CATEGORY III (based on functions ☑ or special characteristics ☐)

1. Category of wetland based on FUNCTIONS

___ **Category I** - Total score = 23 - 27
___ **Category II** - Total score = 20 - 22
X **Category III** - Total score = 16 - 19
___ **Category IV** - Total score = 9 - 15

FUNCTION	Improving Water Quality	Hydrologic	Habitat	
	List appropriate rating (H, M, L)			
Site Potential	H	M	M	
Landscape Potential	H	M	L	
Value	L	M	H	**Total**
Score Based on Ratings	7	6	6	**19**

Score for each function based on three ratings
(*order of ratings is not important*)

9 = H, H, H
8 = H, H, M
7 = H, H, L
7 = H, M, M
6 = H, M, L
6 = M, M, M
5 = H, L, L
5 = M, M, L
4 = M, L, L
3 = L, L, L

2. Category based on SPECIAL CHARACTERISTICS of wetland

CHARACTERISTIC	Category
Estuarine	
Wetland of High Conservation Value	
Bog	
Mature Forest	
Old Growth Forest	
Coastal Lagoon	
Interdunal	
None of the above	X

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (*can be added to map of hydroperiods*)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (*can be added to another figure*)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	L 3.1, L 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	L 3.3	

Slope Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Plant cover of **dense** trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of **dense, rigid** trees, shrubs, and herbaceous plants (*can be added to another figure*)	S 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for ***Riverine*** *wetlands. If it is Saltwater Tidal Fringe it is an* ***Estuarine*** *wetland and is not scored. This method* ***cannot*** *be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
If your wetland can be classified as a Flats wetland, use the form for ***Depressional*** *wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☑ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☑ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☑ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☑ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7 ☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event:		
Depressions cover > $^{3}/_{4}$ area of wetland	points = 8	4
Depressions cover > ½ area of wetland	points = 4	
Depressions present but cover < ½ area of wetland	points = 2	
No depressions present	points = 0	
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes)		
Trees or shrubs > $^{2}/_{3}$ area of the wetland	points = 8	8
☐ Trees or shrubs > $^{1}/_{3}$ area of the wetland	points = 6	
☐ Herbaceous plants (> 6 in high) > $^{2}/_{3}$ area of the wetland	points = 6	
Herbaceous plants (> 6 in high) > $^{1}/_{3}$ area of the wetland	points = 3	
Trees, shrubs, and ungrazed herbaceous < $^{1}/_{3}$ area of the wetland	points = 0	
Total for R 1	Add the points in the boxes above	**12**

Rating of Site Potential If score is: ☑ **12 - 16 = H** ☐ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	Yes = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	Yes = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	Yes = 1 No = 0	0
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	1
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1 - R 2.4? Other Sources	Yes = 1 No = 0	0
Total for R 2	Add the points in the boxes above	**4**

Rating of Landscape Potential If score is: ☑ **3 - 6 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 No = 0	0
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	Yes = 1 No = 0	0
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	Yes = 2 No = 0	0
Total for R 3	Add the points in the boxes above	**0**

Rating of Value If score is: ☐ **2 - 4 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?	
R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).* If the ratio is more than 20 points = 9 If the ratio is 10 - 20 points = 6 If the ratio is 5 - < 10 points = 4 If the ratio is 1 - < 5 points = 2 If the ratio is < 1 points = 1	2
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are* *NOT Cowardin* *classes*). Forest or shrub for > $^1/_3$ area OR emergent plants > $^2/_3$ area points = 7 Forest or shrub for > $^1/_{10}$ area OR emergent plants > $^1/_3$ area points = 4 Plants do not meet above criteria points = 0	7
Total for R 4 Add the points in the boxes above	**9**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?		
R 5.1. Is the stream or river adjacent to the wetland downcut?	Yes = 0 No = 1	1
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	Yes = 1 No = 0	1
R 5.3 Is the up-gradient stream or river controlled by dams?	Yes = 0 No = 1	0
Total for R 5	Add the points in the boxes above	**2**

Rating of Landscape Potential If score is: ☐ **3 = H** ☑ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?	
R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.* The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds) points = 2 Surface flooding problems are in a sub-basin farther down-gradient points = 1 No flooding problems anywhere downstream points = 0	1
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0	0
Total for R 6 Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

☐ Aquatic bed — 4 structures or more: points = 4
☐ Emergent — 3 structures: points = 2
☑ Scrub-shrub (areas where shrubs have > 30% cover) — 2 structures: points - 1
☑ Forested (areas where trees have > 30% cover) — 1 structure: points = 0
If the unit has a Forested class, check if:
☑ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

2

H 1.2. Hydroperiods
Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

☐ Permanently flooded or inundated — 4 or more types present: points = 3
☑ Seasonally flooded or inundated — 3 types present: points = 2
☑ Occasionally flooded or inundated — 2 types present: points = 1
☑ Saturated only — 1 types present: points = 0
☐ Permanently flowing stream or river in, or adjacent to, the wetland
☑ Seasonally flowing stream in, or adjacent to, the wetland
☐ **Lake Fringe wetland** — **2 points**
☐ **Freshwater tidal wetland** — **2 points**

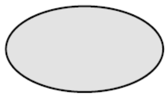
3

H 1.3. Richness of plant species
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

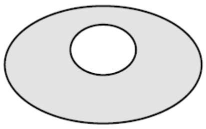
If you counted: > 19 species — points = 2
5 - 19 species — points = 1
< 5 species — points = 0

1

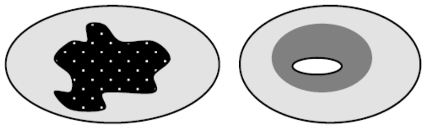
H 1.4. Interspersion of habitats
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points

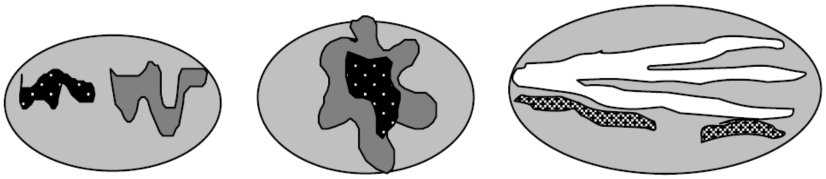


Low = 1 point



Moderate = 2 points

All three diagrams in this row are **HIGH** = 3 points



2

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☑ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☑ Standing snags (dbh > 4 in) within the wetland ☑ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	3
Total for H 1 Add the points in the boxes above	**11**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☑ **7 - 14 = M** ☐ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0 % undisturbed habitat + (9 % moderate & low intensity land uses / 2) = 4.5% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 31 % undisturbed habitat + (17 % moderate & low intensity land uses / 2) = 39.5% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☑ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	2

Rating of Value If Score is: ☑ **2 = H** ☐ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE****: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☑ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type *Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.*	**Category**

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

- ☐ The dominant water regime is tidal,
- ☐ Vegetated, and
- ☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☐ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

- ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25)
- ☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
- ☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions***.

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-16 Date of site visit: 3/2/2020

Rated by A. Hoenig, K. Moser Trained by Ecology? ☑ Yes ☐ No Date of training Oct. 2015

HGM Class used for rating Depressional & Flats Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).
Source of base aerial photo/map ESRI / Google Earth Pro

OVERALL WETLAND CATEGORY III (based on functions ☑ or special characteristics ☐)

1. Category of wetland based on FUNCTIONS

____ **Category I** - Total score = 23 - 27
____ **Category II** - Total score = 20 - 22
X **Category III** - Total score = 16 - 19
____ **Category IV** - Total score = 9 - 15

FUNCTION	**Improving Water Quality**	**Hydrologic**	**Habitat**	
			List appropriate rating (H, M, L)	
Site Potential	M	M	L	
Landscape Potential	M	H	L	
Value	M	M	L	**Total**
Score Based on Ratings	6	7	3	**16**

Score for each function based on three ratings
(*order of ratings is not important*)

9 = H, H, H
8 = H, H, M
7 = H, H, L
7 = H, M, M
6 = H, M, L
6 = M, M, M
5 = H, L, L
5 = M, M, L
4 = M, L, L
3 = L, L, L

2. Category based on SPECIAL CHARACTERISTICS of wetland

CHARACTERISTIC	**Category**
Estuarine	
Wetland of High Conservation Value	
Bog	
Mature Forest	
Old Growth Forest	
Coastal Lagoon	
Interdunal

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (*can be added to map of hydroperiods*)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (*can be added to another figure*)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	L 3.1, L 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	L 3.3	

Slope Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Plant cover of **dense** trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of **dense, rigid** trees, shrubs, and herbaceous plants (*can be added to another figure*)	S 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for ***Riverine*** *wetlands. If it is Saltwater Tidal Fringe it is an* ***Estuarine*** *wetland and is not scored. This method* ***cannot*** *be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
If your wetland can be classified as a Flats wetland, use the form for ***Depressional*** *wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☑ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☑ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☑ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7 ☑ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:
Entire wetland sits in a depression. The wetland is rated as depressional.

DEPRESSIONAL AND FLATS WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

D 1.0. Does the site have the potential to improve water quality?	
D 1.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet). points = 3 Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet. points = 2 ☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing points = 1 ☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch. points = 1	2
D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (*use NRCS definitions*). Yes = 4 No = 0	0
D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes): Wetland has persistent, ungrazed, plants > 95% of area points = 5 Wetland has persistent, ungrazed, plants > ½ of area points = 3 Wetland has persistent, ungrazed plants > $^1/_{10}$ of area points = 1 Wetland has persistent, ungrazed plants < $^1/_{10}$ of area points = 0	3
D 1.4. Characteristics of seasonal ponding or inundation: *This is the area that is ponded for at least 2 months. See description in manual.* Area seasonally ponded is > ½ total area of wetland points = 4 Area seasonally ponded is > ¼ total area of wetland points = 2 Area seasonally ponded is < ¼ total area of wetland points = 0	2
Total for D 1 Add the points in the boxes above	**7**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

D 2.0. Does the landscape have the potential to support the water quality function of the site?	
D 2.1. Does the wetland unit receive stormwater discharges? Yes = 1 No = 0	1
D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants? Yes = 1 No = 0	1
D 2.3. Are there septic systems within 250 ft of the wetland? Yes = 1 No = 0	0
D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3? Source Yes = 1 No = 0	0
Total for D 2 Add the points in the boxes above	**2**

Rating of Landscape Potential If score is: ☐ **3 or 4 = H** ☑ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

D 3.0. Is the water quality improvement provided by the site valuable to society?	
D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list? Yes = 1 No = 0	0
D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list? Yes = 1 No = 0	1
D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (*answer YES if there is a TMDL for the basin in which the unit is found*)? Yes = 2 No = 0	0
Total for D 3 Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

DEPRESSIONAL AND FLATS WETLANDS

Hydrologic Functions - Indicators that the site functions to reduce flooding and stream degradation

D 4.0. Does the site have the potential to reduce flooding and erosion?	
D 4.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression with no surface water leaving it (no outlet) points = 4 Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet points = 2 Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch points = 1 Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing points = 0	2
D 4.2. Depth of storage during wet periods: *Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.* Marks of ponding are 3 ft or more above the surface or bottom of outlet points = 7 Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet points = 5 ☑ Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet points = 3 ☐ The wetland is a “headwater” wetland points = 3 Wetland is flat but has small depressions on the surface that trap water points = 1 Marks of ponding less than 0.5 ft (6 in) points = 0	3
D 4.3. Contribution of the wetland to storage in the watershed: *Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.* ☐ The area of the basin is less than 10 times the area of the unit points = 5 The area of the basin is 10 to 100 times the area of the unit points = 3 The area of the basin is more than 100 times the area of the unit points = 0 ☐ Entire wetland is in the Flats class points = 5	3
Total for D 4 Add the points in the boxes above	**8**

Rating of Site Potential If score is: ☐**12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

D 5.0. Does the landscape have the potential to support hydrologic function of the site?	
D 5.1. Does the wetland unit receive stormwater discharges? Yes = 1 No = 0	1
D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff? Yes = 1 No = 0	1
D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)? Yes = 1 No = 0	1
Total for D 5 Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

D 6.0. Are the hydrologic functions provided by the site valuable to society?	
D 6.1. The unit is in a landscape that has flooding problems. *Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.* The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds): ● Flooding occurs in a sub-basin that is immediately down-gradient of unit. points = 2 ☑ ● Surface flooding problems are in a sub-basin farther down-gradient. points = 1 ☐ Flooding from groundwater is an issue in the sub-basin. points = 1 ☐ The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why points = 0 ☐ There are no problems with flooding downstream of the wetland. points = 0	1
D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0	0
Total for D 6 Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

☐ Aquatic bed	4 structures or more: points = 4
☑ Emergent	3 structures: points = 2
☑ Scrub-shrub (areas where shrubs have > 30% cover)	2 structures: points - 1
☐ Forested (areas where trees have > 30% cover)	1 structure: points = 0

If the unit has a Forested class, check if:

☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

1

H 1.2. Hydroperiods
Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

☐ Permanently flooded or inundated	4 or more types present: points = 3
☑ Seasonally flooded or inundated	3 types present: points = 2
☐ Occasionally flooded or inundated	2 types present: points = 1
☑ Saturated only	1 types present: points = 0
☐ Permanently flowing stream or river in, or adjacent to, the wetland	
☐ Seasonally flowing stream in, or adjacent to, the wetland	
☐ **Lake Fringe wetland**	**2 points**
☐ **Freshwater tidal wetland**	**2 points**

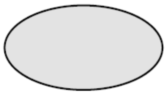
1

H 1.3. Richness of plant species
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

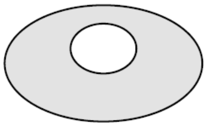
If you counted:	> 19 species	points = 2
	5 - 19 species	points = 1
	< 5 species	points = 0

1

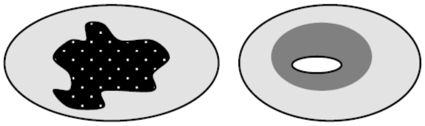
H 1.4. Interspersion of habitats
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points



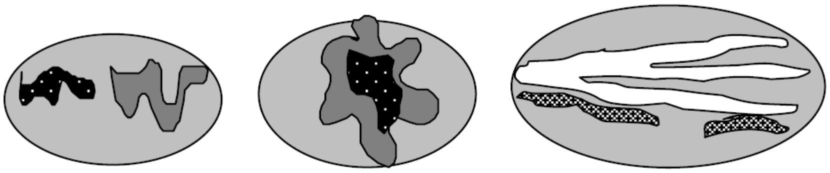
Low = 1 point



Moderate = 2 points

1

All three diagrams
in this row are
HIGH = 3 points



H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☐ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☐ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	0
Total for H 1 Add the points in the boxes above	**4**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☐ **7 - 14 = M** ☑ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0 % undisturbed habitat + (0 % moderate & low intensity land uses / 2) = 0% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 16.8 % undisturbed habitat + (16.5 % moderate & low intensity land uses / 2) = 25.05% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	0

Rating of Value If Score is: ☐ **2 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE**: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☐ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☐ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.	

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,
☐ Vegetated, and
☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☐ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25)

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions*** *.*

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^1/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-17 Date of site visit: 12/19/2019

Rated by A Weiss Trained by Ecology? ☑ Yes ☐ No Date of training Oct-20

HGM Class used for rating Riverine & Fresh Water Tidal Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).

Wetland of High Conservation Value	
Bog	
Mature Forest	
Old Growth Forest	
Coastal Lagoon	
Interdunal	
None of the above	X

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (*can be added to map of hydroperiods*)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (*can be added to another figure*)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	L 3.1, L 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	L 3.3	

Slope Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Plant cover of **dense** trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of **dense, rigid** trees, shrubs, and herbaceous plants (*can be added to another figure*)	S 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☑ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for ***Riverine*** *wetlands. If it is Saltwater Tidal Fringe it is an* ***Estuarine*** *wetland and is not scored. This method* ***cannot*** *be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
If your wetland can be classified as a Flats wetland, use the form for ***Depressional*** *wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☑ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☑ NO - go to 7 ☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☑ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event:		2
Depressions cover > $^{3}/_{4}$ area of wetland	points = 8	
Depressions cover > ½ area of wetland	points = 4	
Depressions present but cover < ½ area of wetland	points = 2	
No depressions present	points = 0	
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes)		6
Trees or shrubs > $^{2}/_{3}$ area of the wetland	points = 8	
☑ Trees or shrubs > $^{1}/_{3}$ area of the wetland	points = 6	
☐ Herbaceous plants (> 6 in high) > $^{2}/_{3}$ area of the wetland	points = 6	
Herbaceous plants (> 6 in high) > $^{1}/_{3}$ area of the wetland	points = 3	
Trees, shrubs, and ungrazed herbaceous < $^{1}/_{3}$ area of the wetland	points = 0	
Total for R 1	Add the points in the boxes above	**8**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	Yes = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	Yes = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	Yes = 1 No = 0	0
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	0
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1 - R 2.4? Other Sources	Yes = 1 No = 0	0
Total for R 2	Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 - 6 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 No = 0	0
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	Yes = 1 No = 0	0
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	Yes = 2 No = 0	0
Total for R 3	Add the points in the boxes above	**0**

Rating of Value If score is: ☐ **2 - 4 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?		
R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).*		
If the ratio is more than 20	points = 9	1
If the ratio is 10 - 20	points = 6	
If the ratio is 5 - < 10	points = 4	
If the ratio is 1 - < 5	points = 2	
If the ratio is < 1	points = 1	
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are* *NOT Cowardin* *classes*).		7
Forest or shrub for > $^{1}/_{3}$ area OR emergent plants > $^{2}/_{3}$ area	points = 7	
Forest or shrub for > $^{1}/_{10}$ area OR emergent plants > $^{1}/_{3}$ area	points = 4	
Plants do not meet above criteria	points = 0	
Total for R 4	Add the points in the boxes above	**8**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?		
R 5.1. Is the stream or river adjacent to the wetland downcut?	Yes = 0 No = 1	1
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	Yes = 1 No = 0	1
R 5.3 Is the up-gradient stream or river controlled by dams?	Yes = 0 No = 1	0
Total for R 5	Add the points in the boxes above	**2**

Rating of Landscape Potential If score is: ☐ **3 = H** ☑ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?		
R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.*		1
The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
Total for R 6	Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

☐ Aquatic bed — 4 structures or more: points = 4
☐ Emergent — 3 structures: points = 2
☐ Scrub-shrub (areas where shrubs have > 30% cover) — 2 structures: points - 1
☑ Forested (areas where trees have > 30% cover) — 1 structure: points = 0
If the unit has a Forested class, check if:
☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

0

H 1.2. Hydroperiods
Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

☐ Permanently flooded or inundated — 4 or more types present: points = 3
☑ Seasonally flooded or inundated — 3 types present: points = 2
☐ Occasionally flooded or inundated — 2 types present: points = 1
☐ Saturated only — 1 types present: points = 0
☐ Permanently flowing stream or river in, or adjacent to, the wetland
☑ Seasonally flowing stream in, or adjacent to, the wetland
☐ **Lake Fringe wetland** — **2 points**
☐ **Freshwater tidal wetland** — **2 points**

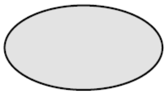
1

H 1.3. Richness of plant species
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

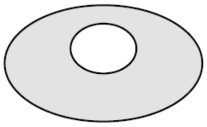
If you counted: > 19 species — points = 2
5 - 19 species — points = 1
< 5 species — points = 0

1

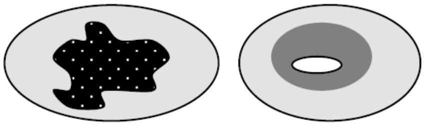
H 1.4. Interspersion of habitats
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points

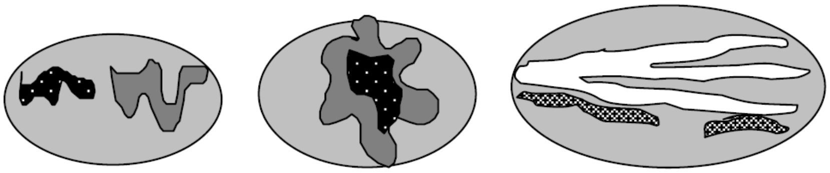


Low = 1 point



Moderate = 2 points

All three diagrams in this row are **HIGH** = 3 points



1

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☑ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☐ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☑ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	2
Total for H 1 Add the points in the boxes above	**5**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☐ **7 - 14 = M** ☑ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 2.9 % undisturbed habitat + (1.4 % moderate & low intensity land uses / 2) = 3.6% If total accessible habitat is: > $^{1}/_{3}$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 21.5 % undisturbed habitat + (18.5 % moderate & low intensity land uses / 2) = 30.75% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☑ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	2

Rating of Value If Score is: ☑ **2 = H** ☐ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE**: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☑ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type *Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.*	**Category**

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,
☐ Vegetated, and
☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☑ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25)
☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☐ Yes - Go to **SC 2.2** ☑ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions*** *.*

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☑ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^1/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103
☐ Grayland-Westport: Lands west of SR 105
☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-18 Date of site visit: 12/19/2019

Rated by A Weiss Trained by Ecology? ☑ Yes ☐ No Date of training Oct-20

HGM Class used for rating Riverine & Fresh Water Tidal Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).

Bog	
Mature Forest	
Old Growth Forest	
Coastal Lagoon	
Interdunal	
None of the above	**x**

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (*can be added to map of hydroperiods*)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (*can be added to another figure*)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	L 3.1, L 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	L 3.3	

Slope Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Plant cover of **dense** trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of **dense, rigid** trees, shrubs, and herbaceous plants (*can be added to another figure*)	S 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☑ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☑ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☑ NO - go to 7 ☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☑ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event:		2
Depressions cover > $^{3}/_{4}$ area of wetland	points = 8	
Depressions cover > ½ area of wetland	points = 4	
Depressions present but cover < ½ area of wetland	points = 2	
No depressions present	points = 0	
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes)		8
Trees or shrubs > $^{2}/_{3}$ area of the wetland	points = 8	
☐ Trees or shrubs > $^{1}/_{3}$ area of the wetland	points = 6	
☐ Herbaceous plants (> 6 in high) > $^{2}/_{3}$ area of the wetland	points = 6	
Herbaceous plants (> 6 in high) > $^{1}/_{3}$ area of the wetland	points = 3	
Trees, shrubs, and ungrazed herbaceous < $^{1}/_{3}$ area of the wetland	points = 0	
Total for R 1	Add the points in the boxes above	**10**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	Yes = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	Yes = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	Yes = 1 No = 0	0
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	1
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1 - R 2.4? Other Sources	Yes = 1 No = 0	0
Total for R 2	Add the points in the boxes above	**4**

Rating of Landscape Potential If score is: ☑ **3 - 6 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 No = 0	0
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	Yes = 1 No = 0	0
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	Yes = 2 No = 0	0
Total for R 3	Add the points in the boxes above	**0**

Rating of Value If score is: ☐ **2 - 4 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?		
R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).*		1
If the ratio is more than 20	points = 9	
If the ratio is 10 - 20	points = 6	
If the ratio is 5 - < 10	points = 4	
If the ratio is 1 - < 5	points = 2	
If the ratio is < 1	points = 1	
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are NOT Cowardin classes).*		7
Forest or shrub for > $^1/_3$ area OR emergent plants > $^2/_3$ area	points = 7	
Forest or shrub for > $^1/_{10}$ area OR emergent plants > $^1/_3$ area	points = 4	
Plants do not meet above criteria	points = 0	
Total for R 4	Add the points in the boxes above	**8**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?		
R 5.1. Is the stream or river adjacent to the wetland downcut?	Yes = 0 No = 1	1
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	Yes = 1 No = 0	1
R 5.3 Is the up-gradient stream or river controlled by dams?	Yes = 0 No = 1	1
Total for R 5	Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?		
R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.*		1
The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
Total for R 6	Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

☐ Aquatic bed	4 structures or more: points = 4
☐ Emergent	3 structures: points = 2
☑ Scrub-shrub (areas where shrubs have > 30% cover)	2 structures: points - 1
☐ Forested (areas where trees have > 30% cover)	1 structure: points = 0

If the unit has a Forested class, check if:

☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

0

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

☐ Permanently flooded or inundated	4 or more types present: points = 3
☐ Seasonally flooded or inundated	3 types present: points = 2
☑ Occasionally flooded or inundated	2 types present: points = 1
☐ Saturated only	1 types present: points = 0
☐ Permanently flowing stream or river in, or adjacent to, the wetland	
☑ Seasonally flowing stream in, or adjacent to, the wetland	
☐ **Lake Fringe wetland**	**2 points**
☐ **Freshwater tidal wetland**	**2 points**

1

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft^2.

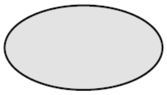
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

If you counted:	> 19 species	points = 2
	5 - 19 species	points = 1
	< 5 species	points = 0

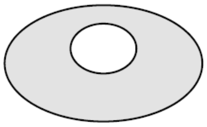
1

H 1.4. Interspersion of habitats

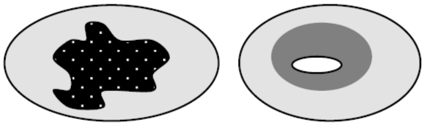
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points



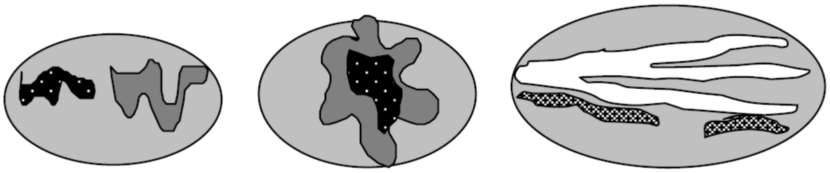
Low = 1 point



Moderate = 2 points

1

All three diagrams in this row are **HIGH** = 3 points



H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☑ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☐ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	1
Total for H 1 — Add the points in the boxes above	**4**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☐ **7 - 14 = M** ☑ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 2.9 % undisturbed habitat + (1.4 % moderate & low intensity land uses / 2) = 3.6% If total accessible habitat is: > $^{1}/_{3}$ (33.3%) of 1 km Polygon — points = 3 20 - 33% of 1 km Polygon — points = 2 10 - 19% of 1 km Polygon — points = 1 < 10 % of 1 km Polygon — points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 22.6 % undisturbed habitat + (17.9 % moderate & low intensity land uses / 2) = 31.55% Undisturbed habitat > 50% of Polygon — points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches — points = 2 Undisturbed habitat 10 - 50% and > 3 patches — points = 1 Undisturbed habitat < 10% of 1 km Polygon — points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use — points = (-2) ≤ 50% of 1km Polygon is high intensity — points = 0	-2
Total for H 2 — Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: — points = 2 ☑ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m — points = 1 Site does not meet any of the criteria above — points = 0	2

Rating of Value If Score is: ☑ **2 = H** ☐ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here: http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE****: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☑ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

Wetland name or number WFW-18

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type | **Category**

Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,
☐ Vegetated, and
☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☑ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25)
☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions*** *.*

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-21 Date of site visit: 2/21/2020

Rated by Josh Wozniak & Matt Murphy Trained by Ecology? ☑ Yes ☐ No Date of training 2014, 2019

HGM Class used for rating Riverine & Fresh Water Tidal Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).

Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☑ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for ***Riverine*** *wetlands. If it is Saltwater Tidal Fringe it is an* ***Estuarine*** *wetland and is not scored. This method* ***cannot*** *be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
If your wetland can be classified as a Flats wetland, use the form for ***Depressional*** *wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☑ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☑ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☑ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☑ NO - go to 7 ☐ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☑ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event:		2
Depressions cover > $^{3}/_{4}$ area of wetland	points = 8	
Depressions cover > ½ area of wetland	points = 4	
Depressions present but cover < ½ area of wetland	points = 2	
No depressions present	points = 0	
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes)		8
Trees or shrubs > $^{2}/_{3}$ area of the wetland	points = 8	
☐ Trees or shrubs > $^{1}/_{3}$ area of the wetland	points = 6	
☐ Herbaceous plants (> 6 in high) > $^{2}/_{3}$ area of the wetland	points = 6	
Herbaceous plants (> 6 in high) > $^{1}/_{3}$ area of the wetland	points = 3	
Trees, shrubs, and ungrazed herbaceous < $^{1}/_{3}$ area of the wetland	points = 0	
Total for R 1	Add the points in the boxes above	**10**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	Yes = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	Yes = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	Yes = 1 No = 0	0
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	1
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1 - R 2.4? Other Sources	Yes = 1 No = 0	0
Total for R 2	Add the points in the boxes above	**4**

Rating of Landscape Potential If score is: ☑ **3 - 6 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 No = 0	0
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	Yes = 1 No = 0	0
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	Yes = 2 No = 0	0
Total for R 3	Add the points in the boxes above	**0**

Rating of Value If score is: ☐ **2 - 4 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?		
R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).*		
If the ratio is more than 20	points = 9	2
If the ratio is 10 - 20	points = 6	
If the ratio is 5 - < 10	points = 4	
If the ratio is 1 - < 5	points = 2	
If the ratio is < 1	points = 1	
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are* *NOT Cowardin* *classes*).		
Forest or shrub for > $^1/_3$ area OR emergent plants > $^2/_3$ area	points = 7	7
Forest or shrub for > $^1/_{10}$ area OR emergent plants > $^1/_3$ area	points = 4	
Plants do not meet above criteria	points = 0	
Total for R 4	Add the points in the boxes above	**9**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?		
R 5.1. Is the stream or river adjacent to the wetland downcut?	Yes = 0 No = 1	1
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	Yes = 1 No = 0	1
R 5.3 Is the up-gradient stream or river controlled by dams?	Yes = 0 No = 1	1
Total for R 5	Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?		
R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.*		
The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	1
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = 0	
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
Total for R 6	Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

☐ Aquatic bed	4 structures or more: points = 4
☐ Emergent	3 structures: points = 2
☑ Scrub-shrub (areas where shrubs have > 30% cover)	2 structures: points - 1
☐ Forested (areas where trees have > 30% cover)	1 structure: points = 0

If the unit has a Forested class, check if:

☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

0

H 1.2. Hydroperiods
Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

☐ Permanently flooded or inundated	4 or more types present: points = 3
☑ Seasonally flooded or inundated	3 types present: points = 2
☐ Occasionally flooded or inundated	2 types present: points = 1
☑ Saturated only	1 types present: points = 0
☐ Permanently flowing stream or river in, or adjacent to, the wetland	
☑ Seasonally flowing stream in, or adjacent to, the wetland	
☐ **Lake Fringe wetland**	**2 points**
☐ **Freshwater tidal wetland**	**2 points**

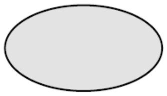
2

H 1.3. Richness of plant species
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

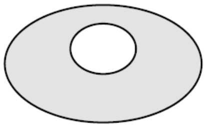
If you counted:	> 19 species	points = 2
	5 - 19 species	points = 1
	< 5 species	points = 0

1

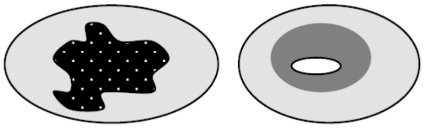
H 1.4. Interspersion of habitats
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points

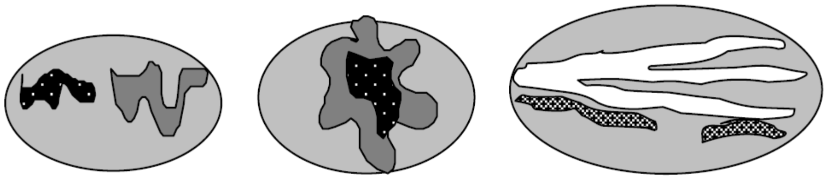


Low = 1 point



Moderate = 2 points

All three diagrams in this row are **HIGH** = 3 points



2

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☑ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☑ Standing snags (dbh > 4 in) within the wetland ☑ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	3
Total for H 1 Add the points in the boxes above	**8**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☑ **7 - 14 = M** ☐ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0.4 % undisturbed habitat + (0 % moderate & low intensity land uses / 2) = 0.4% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 16.8 % undisturbed habitat + (15.2 % moderate & low intensity land uses / 2) = 24.4% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	2
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**0**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☑ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	2

Rating of Value If Score is: ☑ **2 = H** ☐ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE**: This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

- ☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

- ☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

- ☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

- ☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

- ☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

- ☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

- ☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

- ☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

- ☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

- ☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

- ☑ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

- ☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type | **Category**

Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,

☐ Vegetated, and

☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☑ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25)

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☐ Yes - Go to **SC 2.2** ☑ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☑ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions*** *.*

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☑ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☑ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☑ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☑ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-22 Date of site visit: 2/25/2020

Rated by Adam Merrill & Matt Murphy Trained by Ecology? ☑ Yes ☐ No Date of training Oct-19

HGM Class used for rating Depressional & Flats Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).

OVERALL WETLAND CATEGORY III (based on functions ☑ or special characteristics ☐)

1. Category of wetland based on FUNCTIONS

_____ **Category I** - Total score = 23 - 27
_____ **Category II** - Total score = 20 - 22
X **Category III** - Total score = 16 - 19
_____ **Category IV** - Total score = 9 - 15

FUNCTION	Improving Water Quality	Hydrologic	Habitat	
	List appropriate rating (H, M, L)			
Site Potential	L	L	L	
Landscape Potential	H	H	L	
Value	H	M	M	**Total**
Score Based on Ratings	7	6	4	**17**

Score for each function based on three ratings (*order of ratings is not important*)

9 = H, H, H
8 = H, H, M
7 = H, H, L
7 = H, M, M
6 = H, M, L
6 = M, M, M
5 = H, L, L
5 = M, M, L
4 = M, L, L
3 = L, L, L

2. Category based on SPECIAL CHARACTERISTICS of wetland

CHARACTERISTIC	Category
Estuarine	
Wetland of High Conservation Value	
Bog	
Mature Forest	
Old Growth Forest	
Coastal Lagoon	
Interdunal	
None of the above	X

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (*can be added to map of hydroperiods*)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (*can be added to another figure*)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3

Plant cover of **dense** trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of **dense, rigid** trees, shrubs, and herbaceous plants (*can be added to another figure*)	S 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☑ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**

If your wetland can be classified as a Freshwater Tidal Fringe use the forms for ***Riverine*** *wetlands. If it is Saltwater Tidal Fringe it is an* ***Estuarine*** *wetland and is not scored. This method* ***cannot*** *be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**

If your wetland can be classified as a Flats wetland, use the form for ***Depressional*** *wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

☑ NO - go to 6 ☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7 ☑ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☑ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:
A portion of the wetland is riverine and a portion is depressional. Depressional + Riverine along stream within boundary of depression, therefore the HGM class used for this rating is Depressional.

DEPRESSIONAL AND FLATS WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

D 1.0. Does the site have the potential to improve water quality?	
D 1.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet). points = 3 Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet. points = 2 ☑ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing points = 1 ☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch. points = 1	1
D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (*use NRCS definitions*). Yes = 4 No = 0	0
D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes): Wetland has persistent, ungrazed, plants > 95% of area points = 5 Wetland has persistent, ungrazed, plants > ½ of area points = 3 Wetland has persistent, ungrazed plants > $^{1}/_{10}$ of area points = 1 Wetland has persistent, ungrazed plants < $^{1}/_{10}$ of area points = 0	3
D 1.4. Characteristics of seasonal ponding or inundation: *This is the area that is ponded for at least 2 months. See description in manual.* Area seasonally ponded is > ½ total area of wetland points = 4 Area seasonally ponded is > ¼ total area of wetland points = 2 Area seasonally ponded is < ¼ total area of wetland points = 0	0
Total for D 1 Add the points in the boxes above	**4**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☐ **6 - 11 = M** ☑ **0 - 5 = L** *Record the rating on the first page*

D 2.0. Does the landscape have the potential to support the water quality function of the site?	
D 2.1. Does the wetland unit receive stormwater discharges? Yes = 1 No = 0	1
D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants? Yes = 1 No = 0	1
D 2.3. Are there septic systems within 250 ft of the wetland? Yes = 1 No = 0	0
D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3? Source Trash Yes = 1 No = 0	1
Total for D 2 Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 or 4 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

D 3.0. Is the water quality improvement provided by the site valuable to society?	
D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list? Yes = 1 No = 0	1
D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list? Yes = 1 No = 0	1
D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (*answer YES if there is a TMDL for the basin in which the unit is found*)? Yes = 2 No = 0	0
Total for D 3 Add the points in the boxes above	**2**

Rating of Value If score is: ☑ **2 - 4 = H** ☐ **1 = M** ☐ **0 = L** *Record the rating on the first page*

Wetland name or number WFW-22

DEPRESSIONAL AND FLATS WETLANDS

Hydrologic Functions - Indicators that the site functions to reduce flooding and stream degradation

D 4.0. Does the site have the potential to reduce flooding and erosion?		
D 4.1. Characteristics of surface water outflows from the wetland:		0
Wetland is a depression or flat depression with no surface water leaving it (no outlet)	points = 4	
Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet	points = 2	
Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch	points = 1	
Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing	points = 0	
D 4.2. Depth of storage during wet periods: *Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.*		0
Marks of ponding are 3 ft or more above the surface or bottom of outlet	points = 7	
Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet	points = 5	
☐ Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet	points = 3	
☐ The wetland is a "headwater" wetland	points = 3	
Wetland is flat but has small depressions on the surface that trap water	points = 1	
Marks of ponding less than 0.5 ft (6 in)	points = 0	
D 4.3. Contribution of the wetland to storage in the watershed: *Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.*		3
☐ The area of the basin is less than 10 times the area of the unit	points = 5	
The area of the basin is 10 to 100 times the area of the unit	points = 3	
The area of the basin is more than 100 times the area of the unit	points = 0	
☐ Entire wetland is in the Flats class	points = 5	
Total for D 4	Add the points in the boxes above	**3**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☐ **6 - 11 = M** ☑ **0 - 5 = L** *Record the rating on the first page*

D 5.0. Does the landscape have the potential to support hydrologic function of the site?		
D 5.1. Does the wetland unit receive stormwater discharges?	Yes = 1 No = 0	1
D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff?	Yes = 1 No = 0	1
D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?	Yes = 1 No = 0	1
Total for D 5	Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

D 6.0. Are the hydrologic functions provided by the site valuable to society?		
D 6.1. The unit is in a landscape that has flooding problems. *Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.*		1
The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds):		
• Flooding occurs in a sub-basin that is immediately down-gradient of unit.	points = 2	
☑ • Surface flooding problems are in a sub-basin farther down-gradient.	points = 1	
☐ Flooding from groundwater is an issue in the sub-basin.	points = 1	
☐ The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why	points = 0	
☐ There are no problems with flooding downstream of the wetland.	points = 0	
D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
Total for D 6	Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

☐ Aquatic bed	4 structures or more: points = 4
☐ Emergent	3 structures: points = 2
☑ Scrub-shrub (areas where shrubs have > 30% cover)	2 structures: points - 1
☐ Forested (areas where trees have > 30% cover)	1 structure: points = 0

If the unit has a Forested class, check if:

☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

0

H 1.2. Hydroperiods
Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

☐ Permanently flooded or inundated	4 or more types present: points = 3
☐ Seasonally flooded or inundated	3 types present: points = 2
☑ Occasionally flooded or inundated	2 types present: points = 1
☐ Saturated only	1 types present: points = 0
☐ Permanently flowing stream or river in, or adjacent to, the wetland	
☐ Seasonally flowing stream in, or adjacent to, the wetland	
☐ **Lake Fringe wetland**	**2 points**
☐ **Freshwater tidal wetland**	**2 points**

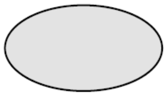
0

H 1.3. Richness of plant species
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

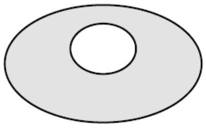
If you counted:	> 19 species	points = 2
	5 - 19 species	points = 1
	< 5 species	points = 0

1

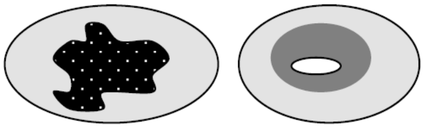
H 1.4. Interspersion of habitats
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points

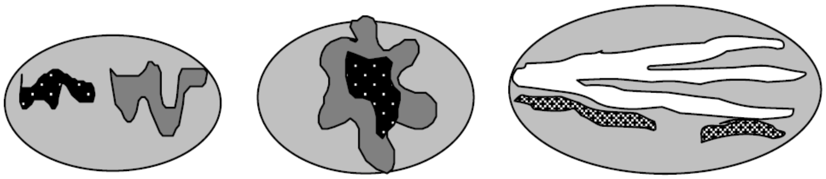


Low = 1 point



Moderate = 2 points

All three diagrams in this row are **HIGH** = 3 points



0

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☐ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☐ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	0
Total for H 1 Add the points in the boxes above	**1**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☐ **7 - 14 = M** ☑ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0.7 % undisturbed habitat + (0 % moderate & low intensity land uses / 2) = 0.7% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 18.6 % undisturbed habitat + (15.8 % moderate & low intensity land uses / 2) = 26.5% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	2
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**0**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	1

Rating of Value If Score is: ☐ **2 = H** ☑ **1 = M** ☑ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here: http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE****: This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☑ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type | **Category**

Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,

☐ Vegetated, and

☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☑ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25)

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☐ Yes - Go to **SC 2.2** ☑ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☑ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions.***

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☑ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☑ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☑ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☑ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-32 Date of site visit: 4/20/2023

Rated by Kaylee Moser and A. Thom Trained by Ecology? ☑ Yes ☐ No Date of training Oct.2018

HGM Class used for rating Depressional & Flats Wetland has multiple HGM classes? ☐ Yes ☑ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**
If your wetland can be classified as a Freshwater Tidal Fringe use the forms for ***Riverine*** *wetlands. If it is Saltwater Tidal Fringe it is an* ***Estuarine*** *wetland and is not scored. This method* ***cannot*** *be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it.
Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**
If your wetland can be classified as a Flats wetland, use the form for ***Depressional*** *wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
☐ The overbank flooding occurs at least once every 2 years.

☑ NO - go to 6 ☐ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7 ☑ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:
Wetland 32 receives water from a stormwater vault at its southern end and discharges into a stormwater feature at its northern edge.

DEPRESSIONAL AND FLATS WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

D 1.0. Does the site have the potential to improve water quality?	
D 1.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet). points = 3 Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet. points = 2 ☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing points = 1 ☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch. points = 1	2
D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (*use NRCS definitions*). Yes = 4 No = 0	0
D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes): Wetland has persistent, ungrazed, plants > 95% of area points = 5 Wetland has persistent, ungrazed, plants > ½ of area points = 3 Wetland has persistent, ungrazed plants > $^{1}/_{10}$ of area points = 1 Wetland has persistent, ungrazed plants < $^{1}/_{10}$ of area points = 0	3
D 1.4. Characteristics of seasonal ponding or inundation: *This is the area that is ponded for at least 2 months. See description in manual.* Area seasonally ponded is > ½ total area of wetland points = 4 Area seasonally ponded is > ¼ total area of wetland points = 2 Area seasonally ponded is < ¼ total area of wetland points = 0	4
Total for D 1 Add the points in the boxes above	**9**

Rating of Site Potential If score is: ☐**12 - 16 = H** ☑**6 - 11 = M** ☐**0 - 5 = L** *Record the rating on the first page*

D 2.0. Does the landscape have the potential to support the water quality function of the site?	
D 2.1. Does the wetland unit receive stormwater discharges? Yes = 1 No = 0	1
D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants? Yes = 1 No = 0	1
D 2.3. Are there septic systems within 250 ft of the wetland? Yes = 1 No = 0	0
D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3? Source Particulates in exhaust from motor vehicles Yes = 1 No = 0	1
Total for D 2 Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 or 4 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

D 3.0. Is the water quality improvement provided by the site valuable to society?	
D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list? Yes = 1 No = 0	0
D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list? Yes = 1 No = 0	0
D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (*answer YES if there is a TMDL for the basin in which the unit is found*)? Yes = 2 No = 0	0
Total for D 3 Add the points in the boxes above	**0**

Rating of Value If score is: ☐**2 - 4 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

DEPRESSIONAL AND FLATS WETLANDS

Hydrologic Functions - Indicators that the site functions to reduce flooding and stream degradation

D 4.0. Does the site have the potential to reduce flooding and erosion?		
D 4.1. Characteristics of surface water outflows from the wetland:		2
Wetland is a depression or flat depression with no surface water leaving it (no outlet)	points = 4	
Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet	points = 2	
Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch	points = 1	
Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing	points = 0	
D 4.2. Depth of storage during wet periods: *Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.*		0
Marks of ponding are 3 ft or more above the surface or bottom of outlet	points = 7	
Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet	points = 5	
☐ Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet	points = 3	
☐ The wetland is a “headwater” wetland	points = 3	
Wetland is flat but has small depressions on the surface that trap water	points = 1	
Marks of ponding less than 0.5 ft (6 in)	points = 0	
D 4.3. Contribution of the wetland to storage in the watershed: *Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.*		0
☐ The area of the basin is less than 10 times the area of the unit	points = 5	
The area of the basin is 10 to 100 times the area of the unit	points = 3	
The area of the basin is more than 100 times the area of the unit	points = 0	
☐ Entire wetland is in the Flats class	points = 5	
Total for D 4	Add the points in the boxes above	**2**

Rating of Site Potential If score is: ☐**12 - 16 = H** ☐**6 - 11 = M** ☑**0 - 5 = L** *Record the rating on the first page*

D 5.0. Does the landscape have the potential to support hydrologic function of the site?		
D 5.1. Does the wetland unit receive stormwater discharges?	Yes = 1 No = 0	1
D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff?	Yes = 1 No = 0	1
D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?	Yes = 1 No = 0	1
Total for D 5	Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑**3 = H** ☐**1 or 2 = M** ☐**0 = L** *Record the rating on the first page*

D 6.0. Are the hydrologic functions provided by the site valuable to society?		
D 6.1. The unit is in a landscape that has flooding problems. *Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.*		1
The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds):		
● Flooding occurs in a sub-basin that is immediately down-gradient of unit.	points = 2	
☑ ● Surface flooding problems are in a sub-basin farther down-gradient.	points = 1	
☐ Flooding from groundwater is an issue in the sub-basin.	points = 1	
☐ The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why	points = 0	
☐ There are no problems with flooding downstream of the wetland.	points = 0	
D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
Total for D 6	Add the points in the boxes above	**1**

Rating of Value If score is: ☐**2 - 4 = H** ☑**1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

☐ Aquatic bed	4 structures or more: points = 4	1
☑ Emergent	3 structures: points = 2	
☑ Scrub-shrub (areas where shrubs have > 30% cover)	2 structures: points - 1	
☐ Forested (areas where trees have > 30% cover)	1 structure: points = 0	

If the unit has a Forested class, check if:

☐ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

☐ Permanently flooded or inundated	4 or more types present: points = 3	
☑ Seasonally flooded or inundated	3 types present: points = 2	1
☐ Occasionally flooded or inundated	2 types present: points = 1	
☑ Saturated only	1 types present: points = 0	
☐ Permanently flowing stream or river in, or adjacent to, the wetland		
☐ Seasonally flowing stream in, or adjacent to, the wetland		
☐ **Lake Fringe wetland**	**2 points**	
☐ **Freshwater tidal wetland**	**2 points**	

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

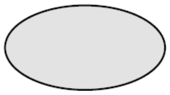
0

If you counted:	> 19 species	points = 2	
	5 - 19 species	points = 1	
	< 5 species	points = 0	

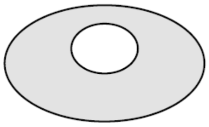
H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

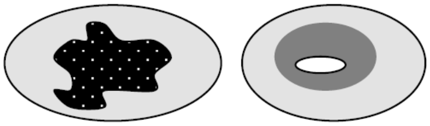
1



None = 0 points

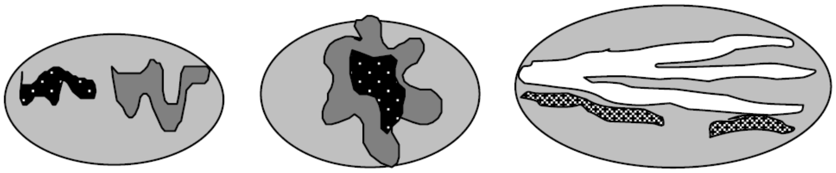


Low = 1 point



Moderate = 2 points

All three diagrams
in this row are
HIGH = 3 points



H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☐ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☐ Standing snags (dbh > 4 in) within the wetland ☐ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by amphibians*) ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	0
Total for H 1 Add the points in the boxes above	**3**

Rating of Site Potential If Score is: ☐**15 - 18 = H** ☐ **7 - 14 = M** ☑**0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0 % undisturbed habitat + (0 % moderate & low intensity land uses / 2) = 0% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 18.6 % undisturbed habitat + (7.5 % moderate & low intensity land uses / 2) = 22.35% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑**< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	0

Rating of Value If Score is: ☐ **2 = H** ☐ **1 = M** ☑ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE****: This question is independent of the land use between the wetland unit and the priority habitat.*

- ☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- ☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- ☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.
- ☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- ☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- ☐ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- ☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- ☐ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- ☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- ☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- ☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- ☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- ☐ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type *Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.*	**Category**

SC 1.0. Estuarine Wetlands

Does the wetland meet the following criteria for Estuarine wetlands?

☐ The dominant water regime is tidal,
☐ Vegetated, and
☐ With a salinity greater than 0.5 ppt

☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**

SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?

☐ Yes = **Category I** ☐ No - Go to **SC 1.2**

SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25)
☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.

☐ Yes = **Category I** ☐ No = **Category II**

SC 2.0. Wetlands of High Conservation Value (WHCV)

SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?

☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3**

SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?

☐ Yes = **Category I** ☑ No = **Not WHCV**

SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?
http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf

☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV**

SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?

☐ Yes = **Category I** ☐ No = **Not WHCV**

SC 3.0. Bogs

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions***.

SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?

☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2**

SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?

☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog**

SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?

☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4**

NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?

☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^1/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

RATING SUMMARY – Western Washington

Name of wetland (or ID #): WFW-33 Date of site visit: NONE

Rated by A. Hoenig Trained by Ecology? ☑ Yes ☐ No Date of training Oct. 2015

HGM Class used for rating Depressional & Flats Wetland has multiple HGM classes? ☑ Yes ☐ No

NOTE: Form is not complete with out the figures requested (*figures can be combined*).
Source of base aerial photo/map ESRI / Google Earth Pro

OVERALL WETLAND CATEGORY II (based on functions ☑ or special characteristics ☐)

1. Category of wetland based on FUNCTIONS

___ **Category I** - Total score = 23 - 27
X **Category II** - Total score = 20 - 22
___ **Category III** - Total score = 16 - 19
___ **Category IV** - Total score = 9 - 15

FUNCTION	**Improving Water Quality**	**Hydrologic**	**Habitat**	
	List appropriate rating (H, M, L)			
Site Potential	M	M	M	
Landscape Potential	H	H	L	
Value	H	M	M	**Total**
Score Based on Ratings	8	7	5	**20**

Score for each function based on three ratings
(*order of ratings is not important*)

9 = H, H, H
8 = H, H, M
7 = H, H, L
7 = H, M, M
6 = H, M, L
6 = M, M, M
5 = H, L, L
5 = M, M, L
4 = M, L, L
3 = L, L, L

2. Category based on SPECIAL CHARACTERISTICS of wetland

CHARACTERISTIC	**Category**
Estuarine	
Wetland of High Conservation Value	
Bog	
Mature Forest	
Old Growth Forest	
Coastal Lagoon	
Interdunal	
None of the above	X

Maps and Figures required to answer questions correctly for Western Washington

Depressional Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	D 1.3, H 1.1, H 1.4	
Hydroperiods	D 1.4, H 1.2	
Location of outlet (*can be added to map of hydroperiods*)	D 1.1, D 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	D 2.2, D 5.2	
Map of the contributing basin	D 4.3, D 5.3	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	D 3.1, D 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	D 3.3	

Riverine Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Ponded depressions	R 1.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	R 2.4	
Plant cover of trees, shrubs, and herbaceous plants	R 1.2, R 4.2	
Width of unit vs. width of stream (*can be added to another figure*)	R 4.1	
Map of the contributing basin	R 2.2, R 2.3, R 5.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	R 3.1	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	R 3.2, R 3.3	

Lake Fringe Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	L 1.1, L 4.1, H 1.1, H 1.4	
Plant cover of trees, shrubs, and herbaceous plants	L 1.2	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	L 2.2	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	L 3.1, L 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	L 3.3	

Slope Wetlands

Map of:	To answer questions:	Figure #
Cowardin plant classes	H 1.1, H 1.4	
Hydroperiods	H 1.2	
Plant cover of **dense** trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of **dense, rigid** trees, shrubs, and herbaceous plants (*can be added to another figure*)	S 4.1	
Boundary of area within 150 ft of the wetland (*can be added to another figure*)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

HGM Classification of Wetland in Western Washington

For questions 1 -7, the criteria described must apply to the entire unit being rated.
If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1 - 7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

☑ NO - go to 2 ☐ **YES** - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

☐ **NO - Saltwater Tidal Fringe (Estuarine)** ☐ **YES - Freshwater Tidal Fringe**

If your wetland can be classified as a Freshwater Tidal Fringe use the forms for ***Riverine*** *wetlands. If it is Saltwater Tidal Fringe it is an* ***Estuarine*** *wetland and is not scored. This method* ***cannot*** *be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

☑ NO - go to 3 ☐ **YES** - The wetland class is **Flats**

If your wetland can be classified as a Flats wetland, use the form for ***Depressional*** *wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

☐ At least 30% of the open water area is deeper than 6.6 ft (2 m).

☑ NO - go to 4 ☐ **YES** - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

☐ The wetland is on a slope (*slope can be very gradual*),

☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.

☐ The water leaves the wetland **without being impounded.**

☑ NO - go to 5 ☐ **YES** - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

☑ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,

☑ The overbank flooding occurs at least once every 2 years.

☐ NO - go to 6 ☑ **YES** - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the*

☐ NO - go to 7 ☑ **YES** - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8 ☐ **YES** - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

NOTES and FIELD OBSERVATIONS:
A portion of the wetland is riverine and a portion is depressional. Depressional + Riverine along stream within boundary of depression, therefore the HGM class used for this rating is Depressional.

DEPRESSIONAL AND FLATS WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

D 1.0. Does the site have the potential to improve water quality?	
D 1.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet). points = 3 Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet. points = 2 ☐ Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing points = 1 ☐ Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch. points = 1	2
D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (*use NRCS definitions*). Yes = 4 No = 0	0
D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes): Wetland has persistent, ungrazed, plants > 95% of area points = 5 Wetland has persistent, ungrazed, plants > ½ of area points = 3 Wetland has persistent, ungrazed plants > $^1/_{10}$ of area points = 1 Wetland has persistent, ungrazed plants < $^1/_{10}$ of area points = 0	5
D 1.4. Characteristics of seasonal ponding or inundation: *This is the area that is ponded for at least 2 months. See description in manual.* Area seasonally ponded is > ½ total area of wetland points = 4 Area seasonally ponded is > ¼ total area of wetland points = 2 Area seasonally ponded is < ¼ total area of wetland points = 0	2
Total for D 1 Add the points in the boxes above	**9**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

D 2.0. Does the landscape have the potential to support the water quality function of the site?	
D 2.1. Does the wetland unit receive stormwater discharges? Yes = 1 No = 0	1
D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants? Yes = 1 No = 0	1
D 2.3. Are there septic systems within 250 ft of the wetland? Yes = 1 No = 0	0
D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1 - D 2.3? Source trash Yes = 1 No = 0	1
Total for D 2 Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 or 4 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

D 3.0. Is the water quality improvement provided by the site valuable to society?	
D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list? Yes = 1 No = 0	1
D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list? Yes = 1 No = 0	1
D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (*answer YES if there is a TMDL for the basin in which the unit is found*)? Yes = 2 No = 0	0
Total for D 3 Add the points in the boxes above	**2**

Rating of Value If score is: ☑ **2 - 4 = H** ☐ **1 = M** ☐ **0 = L** *Record the rating on the first page*

DEPRESSIONAL AND FLATS WETLANDS

Hydrologic Functions - Indicators that the site functions to reduce flooding and stream degradation

D 4.0. Does the site have the potential to reduce flooding and erosion?		
D 4.1. Characteristics of surface water outflows from the wetland:		2
Wetland is a depression or flat depression with no surface water leaving it (no outlet)	points = 4	
Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet	points = 2	
Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch	points = 1	
Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing	points = 0	
D 4.2. Depth of storage during wet periods: *Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.*		5
Marks of ponding are 3 ft or more above the surface or bottom of outlet	points = 7	
Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet	points = 5	
☐ Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet	points = 3	
☐ The wetland is a “headwater” wetland	points = 3	
Wetland is flat but has small depressions on the surface that trap water	points = 1	
Marks of ponding less than 0.5 ft (6 in)	points = 0	
D 4.3. Contribution of the wetland to storage in the watershed: *Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.*		0
☐ The area of the basin is less than 10 times the area of the unit	points = 5	
The area of the basin is 10 to 100 times the area of the unit	points = 3	
The area of the basin is more than 100 times the area of the unit	points = 0	
☐ Entire wetland is in the Flats class	points = 5	
Total for D 4	Add the points in the boxes above	**7**

Rating of Site Potential If score is: ☐ **12 - 16 = H** ☑ **6 - 11 = M** ☐ **0 - 5 = L** *Record the rating on the first page*

D 5.0. Does the landscape have the potential to support hydrologic function of the site?		
D 5.1. Does the wetland unit receive stormwater discharges?	Yes = 1 No = 0	1
D 5.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate excess runoff?	Yes = 1 No = 0	1
D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?	Yes = 1 No = 0	1
Total for D 5	Add the points in the boxes above	**3**

Rating of Landscape Potential If score is: ☑ **3 = H** ☐ **1 or 2 = M** ☐ **0 = L** *Record the rating on the first page*

D 6.0. Are the hydrologic functions provided by the site valuable to society?		
D 6.1. The unit is in a landscape that has flooding problems. *Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.*		1
The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon		
• Flooding occurs in a sub-basin that is immediately down-gradient of unit.	points = 2	
☑ • Surface flooding problems are in a sub-basin farther down-gradient.	points = 1	
☐ Flooding from groundwater is an issue in the sub-basin.	points = 1	
☐ The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why	points = 0	
☐ There are no problems with flooding downstream of the wetland.	points = 0	
D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 No = 0	0
Total for D 6	Add the points in the boxes above	**1**

Rating of Value If score is: ☐ **2 - 4 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

- ☐ Aquatic bed
- ☐ Emergent
- ☐ Scrub-shrub (areas where shrubs have > 30% cover)
- ☑ Forested (areas where trees have > 30% cover)

4 structures or more: points = 4
3 structures: points = 2
2 structures: points - 1
1 structure: points = 0

If the unit has a Forested class, check if:

- ☑ The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

1

H 1.2. Hydroperiods
Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- ☐ Permanently flooded or inundated
- ☑ Seasonally flooded or inundated
- ☑ Occasionally flooded or inundated
- ☐ Saturated only
- ☐ Permanently flowing stream or river in, or adjacent to, the wetland
- ☑ Seasonally flowing stream in, or adjacent to, the wetland
- ☐ **Lake Fringe wetland** **2 points**
- ☐ **Freshwater tidal wetland** **2 points**

4 or more types present: points = 3
3 types present: points = 2
2 types present: points = 1
1 types present: points = 0

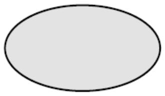
2

H 1.3. Richness of plant species
Count the number of plant species in the wetland that cover at least 10 ft^2.
Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

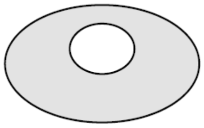
If you counted:		
	> 19 species	points = 2
	5 - 19 species	points = 1
	< 5 species	points = 0

1

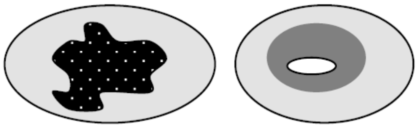
H 1.4. Interspersion of habitats
Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*



None = 0 points

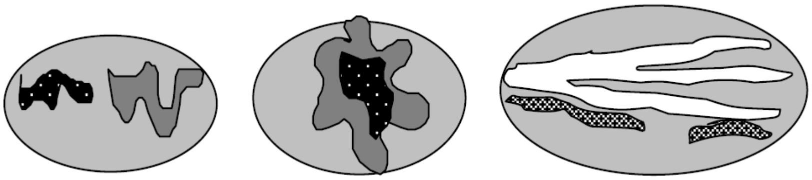


Low = 1 point



Moderate = 2 points

All three diagrams in this row are **HIGH** = 3 points



1

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ☑ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long) ☑ Standing snags (dbh > 4 in) within the wetland ☑ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (*cut shrubs or trees that have not yet weathered where wood is exposed*) ☐ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (*structures for egg-laying by* ☐ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	3
Total for H 1 Add the points in the boxes above	**8**

Rating of Site Potential If Score is: ☐ **15 - 18 = H** ☑ **7 - 14 = M** ☐ **0 - 6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat function of the site?	
H 2.1 Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 0.6 % undisturbed habitat + (0 % moderate & low intensity land uses / 2) = 0.6% If total accessible habitat is: > $^1/_3$ (33.3%) of 1 km Polygon points = 3 20 - 33% of 1 km Polygon points = 2 10 - 19% of 1 km Polygon points = 1 < 10 % of 1 km Polygon points = 0	0
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 24 % undisturbed habitat + (11 % moderate & low intensity land uses / 2) = 29.5% Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3 Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (-2) ≤ 50% of 1km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	**-1**

Rating of Landscape Potential If Score is: ☐ **4 - 6 = H** ☐ **1 - 3 = M** ☑ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated*. Site meets ANY of the following criteria: points = 2 ☐ It has 3 or more priority habitats within 100 m (see next page) ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) ☐ It is mapped as a location for an individual WDFW priority species ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) with in 100m points = 1 Site does not meet any of the criteria above points = 0	1

Rating of Value If Score is: ☐ **2 = H** ☑ **1 = M** ☐ **0 = L** *Record the rating on the first page*

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp.
http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here:
http://wdfw.wa.gov/conservation/phs/list/

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE**: This question is independent of the land use between the wetland unit and the priority habitat.*

☐ **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

☐ **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

☑ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

☐ **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).

☐ **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☑ **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type *Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.*	**Category**
SC 1.0. Estuarine Wetlands Does the wetland meet the following criteria for Estuarine wetlands? ☐ The dominant water regime is tidal, ☐ Vegetated, and ☐ With a salinity greater than 0.5 ppt ☐ Yes - Go to **SC 1.1** ☑ No = **Not an estuarine wetland**	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? ☐ Yes = **Category I** ☐ No - Go to **SC 1.2**	
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina* , see page 25) ☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. ☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. ☐ Yes = **Category I** ☐ No = **Category II**	
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? ☑ Yes - Go to **SC 2.2** ☐ No - Go to **SC 2.3** SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value ☐ Yes = **Category I** ☑ No = **Not WHCV** SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf ☐ Yes - **Contact WNHP/WDNR and to SC 2.4** ☐ No = **Not WHCV** SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? ☐ Yes = **Category I** ☐ No = **Not WHCV**	
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions*** . SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? ☐ Yes - Go to **SC 3.3** ☑ No - Go to **SC 3.2** SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? ☐ Yes - Go to **SC 3.3** ☑ No = **Is not a bog** SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? ☐ Yes = **Is a Category I bog** ☐ No - Go to **SC 3.4** **NOTE**: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? ☐ Yes = **Is a Category I bog** ☐ No = **Is not a bog**	

SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.***

☐ **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.

☐ **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

☐ Yes = **Category I** ☑ No = **Not a forested wetland for this section**

SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

☐ Yes - Go to **SC 5.1** ☑ No = **Not a wetland in a coastal lagoon**

SC 5.1. Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2)

☐ Yes = **Category I** ☐ No = **Category II**

SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.***

In practical terms that means the following geographic areas:

☐ Long Beach Peninsula: Lands west of SR 103

☐ Grayland-Westport: Lands west of SR 105

☐ Ocean Shores-Copalis: Lands west of SR 115 and SR 109

☐ Yes - Go to **SC 6.1** ☑ No = **Not an interdunal wetland for rating**

SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

☐ Yes = **Category I** ☐ No - Go to **SC 6.2**

SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

☐ Yes = **Category II** ☐ No - Go to **SC 6.3**

SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

☐ Yes = **Category III** ☐ No = **Category IV**

Category of wetland based on Special Characteristics

If you answered No for all types, enter "Not Applicable" on Summary Form

Animals

Common Name	Scientific Name
Fish	
Bull Trout	*Salvelinus confluentus*
Chinook Salmon	*Oncorhynchus tshawytscha*
Chum Salmon	*Oncorhynchus keta*
Coho Salmon	*Oncorhynchus kisutch*
Coastal Cutthroat Trout	*Oncorhynchus clarki clarki*
Pink Salmon	*Oncorhynchus gorbuscha*
Sculpin	*Cottus* spp.
Sockeye Salmon	*Oncorhynchus nerka*
Steelhead/Rainbow Trout	*Oncorhynchus mykiss*
Western Brook Lamprey	*Lampetra richardsoni*
Wildlife	
American Crow	*Corvus brachyrhynchos*
American Kestrel	*Falco sparverius*
American Robin	*Turdus migratorius*
Band-tailed Pigeon	*Patagioenas fasciata*
Barn Swallow	*Hirundo rustica*
Barrow's Goldeneye	*Bucephala islandica*
Bewick's Wren	*Thryomanes bewickii*
Big brown Bat	*Eptesicus fuscus*
Black-capped Chickadee	*Poecile atricapillus*
Brant	*Branta bernicla*
Cliff Swallow	*Petrochelidon pyrrhonota*
Common Goldeneye	*Bucephala clangula*
Common Loon	*Gavia immer*
Cooper's Hawk	*Accipiter cooperii*
Coyote	*Canis latrans*
Deer (Black-tailed)	*Odocoileus hemionus columbianus*
Eastern Gray Squirrel	*Sciurus carolinensis*
Ensatina	*Ensatina eschscholtzii*
European Starling	*Sturnus vulgaris*
Gray Wolf	*Canis lupus*
Great Blue Heron	*Ardea herodias*
Great Horned Owl	*Bubo virginianus*

Common Name	Scientific Name
Hooded Merganser	*Lophodytes cucullatus*
House Sparrow	*Passer domesticus*
Marbled Murrelet	*Brachyramphus marmoratus*
Meadow Vole	*Microtus pennsylvanicus*
Myotis (Mouse-eared) Bats	*Myotis* spp.
North American Wolverine	*Gulo gulo*
Northern Flicker	*Colaptes auratus*
Northern Harrier	*Circus cyaneus*
Oregon Vesper Sparrow	*Pooecetes gramineus affinis*
Pileated Woodpecker	*Dryocopus pileatus*
Raccoon	*Procyon lotor*
Red-breasted Nuthatch	*Sitta canadensis*
Red-tailed Hawk	*Buteo jamaicensis*
Rock Pigeon	*Columba livia*
Savannah Sparrow	*Passerculus sandwichensis*
Sharp-shinned Hawk	*Accipiter striatus*
Song Sparrow	*Melospiza melodia*
Spotted Towhee	*Pipilo maculatus*
Steller's Jay	*Cyanocitta stelleri*
Streaked Horned Lark	*Eremophila alpestris strigata*
Swallowtail Butterfly	*Papilio* spp.
Townsend's Big-eared Bat	*Corynorhinus townsendii*
Townsend's Mole	*Scapanus townsendii*
Trumpeter Swan	*Cygnus buccinator*
Tundra Swan	*Cygnus columbianus*
Vaux's Swift	*Chaetura vauxi*
Virginia Opossum	*Didelphis virginiana*
Voles	*Microtus* spp.
Western Grebe	*Aechmophorus occidentalis*
Western Toad	*Anaxyrus boreas*
White-crowned Sparrow	*Zonotrichia leucophrys*
Wood Duck	*Aix sponsa*
Yellow-billed Cuckoo	*Coccyzus americanus*

Plants

Common Name	Scientific Name[a]
American Vetch	*Vicia americana*
Austrian Pine	*Pinus nigra*
Beaked Hazelnut	*Corylus cornuta*
Bentgrass	*Agrostis* sp.
Bigleaf Maple	*Acer macrophyllum*
Bird Cherry	*Prunus avium*
Black Cottonwood	*Populus trichocarpa* (syn: *P. balsamifera* ssp. *trichocarpa trichocarpa*[b] ; *P. balsamifera*[c])
Bluegrass	*Poa* sp.
Bermuda grass	*Cynodon dactylon*
St. John's-wort	*Hypericum perforatum*
Cattail	*Typha latifolia*
Colonial Bentgrass	*Agrostis capillaris*
Common Rush	*Juncus effusus*
Common Snowberry	*Symphoricarpos albus*
Common Spikerush	*Eleocharis palustris*
Common Velvetgrass	*Holcus lanatus*
Creeping Buttercup	*Ranunculus repens*
Cutleaf Blackberry (also, Evergreen Blackberry)	*Rubus laciniatus*
Douglas-fir	*Pseudotsuga menziesii*
Douglas Spiraea (also, Hardhack, Rose Spiraea)	*Spiraea douglasii*
English Ivy	*Hedera helix*
Eurasian Water Milfoil	*Myriophyllum spicatum*
European Hawthorn	*Crataegus monogyna*
European Mountain Ash	*Sorbus aucuparia*
Giant Horsetail	*Equisetum telmateia*
Golden Paintbrush	*Castilleja levisecta*
Grand Fir	*Abies grandis*
Himalayan Blackberry	*Rubus bifrons* (syn: *R. armeniacus*[b, c])
Black Locust	*Robinia pseudoacacia*
Hooker's Willow	*Salix hookeriana*

Common Name	Scientific Name[a]
Kentucky Bluegrass	*Poa pratensis*
Lady Fern	*Athyrium filix-femina* ssp. *cyclosorum* (syn: *A. cyclosorum*[c])
Lombardy Poplar	*Populus nigra*
Norway Maple	*Acer platanoides*
Orange-eye Butterfly-bush	*Buddleja davidii*
Oregon Ash	*Fraxinus latifolia*
Osoberry	*Oemleria cerasiformis*
Pacific Madrone	*Arbutus menziesii*
Pacific Willow	*Salix lasiandra* (syn: *S. lucida* ssp. *lasiandra*[b])
Red Alder	*Alnus rubra*
Red Elderberry	*Sambucus racemosa*
Red Fescue	*Festuca rubra*
Red-osier Dogwood (also, Red Twig Dogwood	*Cornus occidentalis* (syn: *C. sericea*[b], *C. alba*[c])
Reed Canarygrass	*Phalaris arundinacea*
Salal	*Gaultheria shallon*
Salmonberry	*Rubus spectabilis*
Scotch Broom	*Cytisus scoparius*
Scouler's Willow	*Salix scouleriana*
Shore Pine	*Pinus contorta*
Sitka Spruce	*Picea sitchensis*
Sitka Willow	*Salix sitchensis*
Slough Sedge	*Carex obnupta*
Soft-stem Bulrush	*Schoenoplectus tabernaemontani*
Sword Fern	*Polystichum munitum*
Swamp Smartweed	*Persicaria hydropiperoides*
Tall fescue	*Schedonorus arundinaceus*
Twinberry	*Lonicera involucrata*
Violet	*Viola* sp.
Vine Maple	*Acer circinatum*
Western Redcedar	*Thuja plicata*
Willow	*Salix sp.*

SOUNDTRANSIT

June 2024

Summary

The Central Puget Sound Regional Transit Authority (Sound Transit) proposes to construct and operate an operations and maintenance facility in its South Corridor to meet agency needs for an expanded fleet of light rail vehicles (LRVs). The need to expand LRV maintenance capacity was identified in Sound Transit 3: The Regional Transit System Plan for Central Puget Sound. The Operations and Maintenance Facility South (OMF South) would be used to store, maintain, and deploy approximately 144 LRVs for daily service. It would provide facilities for vehicle storage, inspections, maintenance and repair, interior vehicle cleaning, and exterior vehicle washing. Additionally, the facility would receive, test, and commission new LRVs for the entire light rail system.

OMF South would also be used to accommodate administrative and operational functions, such as serving as a report base for LRV operators. Included is a Maintenance of Way building for maintenance and storage of spare parts for tracks, vehicle propulsion equipment, train signals, and other infrastructure, in addition to storage facilities for the entire Link system. Other facility elements would include employee and visitor parking, operations staff offices, maintenance staff offices, dispatcher work stations, an employee report room, and areas with lockers, showers, and restrooms for both operators and maintenance personnel.

OMF South would need to have tracks connecting to a light rail line that will be operating when the facility is planned to open, which in southern King County is the Federal Way Link Extension. The length and location of these connecting tracks varies by alternative. Three site alternatives for the proposed project were evaluated in a State Environmental Policy Act (SEPA) Draft Environmental Impact Statement (EIS) published on March 5, 2021: two in Federal Way and one in Kent. These alternatives are named the Preferred Alternative, South 344th Street Alternative, and Midway Landfill Alternative, respectively.

After publication of the 2021 SEPA Draft EIS, Sound Transit identified potential funding opportunities with the Federal Transit Administration (FTA). Subsequently, FTA issued a notice of intent to prepare an EIS under the National Environmental Policy Act (NEPA) in the Federal Register on July 19, 2023. To reduce duplication of process, FTA and Sound Transit prepared a combined NEPA/SEPA document that served as a Draft EIS under NEPA and a Draft Supplemental EIS under SEPA. This report is an appendix to the Final EIS.

As lead agency under SEPA, Sound Transit commissioned a cultural resource study for the three alternatives within the Area of Potential Effects (APE). Project tasks included the preparation of a methods memorandum and Cultural Resources Survey Plan, which were provided to the Washington State Department of Archaeology and Historic Preservation and coordinating Tribes for review. Those Tribes consisted of the Muckleshoot Indian Tribe, the Nisqually Indian Tribe, the Puyallup Tribe of the Puyallup Reservation, and the Confederated Tribes and Bands of the Yakama Nation. This report includes results of the cultural resources survey conducted for the project and recommendations.

The three OMF South site alternatives were surveyed for archaeological resources over multiple field sessions. No archaeological resources within the APE have previously been determined eligible for or listed in the National Register of Historic Places, Washington Heritage Register, or King County Register of Historic Places. Additionally, these surveys did not identify any archaeological resources that meet the necessary eligibility criteria for those registers. Sound Transit has developed an Inadvertent Discovery Plan to guide procedures for identifying and addressing inadvertent discovery of archaeological resources prior to construction. Further investigations of the mainline sections of the Preferred and South 344th Street alternatives that overlap the Tacoma Dome Link Extension study area were conducted in 2021 after the archaeological surveys were completed for OMF South. These investigations did not identify any archaeological resources that meet the necessary eligibility criteria for the National Register of Historic Places, Washington Heritage Register, or King County Register of Historic Places.

As lead agency under NEPA, FTA initiated Section 106 consultation and requested comments on the APE in letters dated July 20, 2023 to the Muckleshoot Indian Tribe, Nisqually Indian Tribe, Puyallup Tribe of the Puyallup Reservation, Snoqualmie Indian Tribe, Suquamish Indian Tribe of the Port Madison Reservation, Squaxin Island Tribe of the Squaxin Island Reservation, Confederated Tribes and Bands of the Yakama Nation, State Historic Preservation Officer, and the Bonneville Power Association.

A total of 86 historic-period, built-environment resources were surveyed within the APE for the three proposed OMF South site alternatives. No historic, built-environment resources within the APE have previously been determined eligible or listed in the National Register of Historic Places, Washington Heritage Register, or King County Register of Historic Places, with the exception of the Tacoma-Covington No. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines, determined eligible for listing in the NRHP. Under a separate evaluation, the Bonneville Power Association determined that raising the transmission lines to accommodate the OMF South project would have no adverse effect on historic properties under Section 106, a finding with which the State Historic Preservation Officer has concurred (see Attachment G4-6). Subsequently, FTA determined, and the State Historic Preservation Officer concurred, that the OMF South project would have no adverse effect on historic properties under Section 106. Additionally, the surveys did not identify any other historic, built-environment resources that met criteria necessary for being eligible for those registers.

1 INTRODUCTION

The Central Puget Sound Regional Transit Authority (Sound Transit), in consultation with the Federal Transit Administration (FTA), proposes to expand light rail into southern King County and northern Pierce County. Sound Transit proposes to build an operations and maintenance facility (OMF) to support the light rail fleet necessary to extend light rail into Sound Transit's South Corridor, which will serve future growth in ridership systemwide. Three site alternatives for the proposed project were evaluated in a State Environmental Policy Act (SEPA) Draft Environmental Impact Statement (EIS) published on March 5, 2021: two in Federal Way and one in Kent. These alternatives are the South 336th Street Alternative (the Preferred Alternative), South 344th Street Alternative, and Midway Landfill Alternative, respectively.

After publication of the 2021 SEPA Draft EIS, Sound Transit identified potential funding opportunities with the Federal Transit Administration (FTA). Subsequently, FTA issued a notice of intent to prepare an EIS under the National Environmental Policy Act (NEPA) in the Federal Register on July 19, 2023. To reduce duplication of process, FTA and Sound Transit prepared a combined NEPA/SEPA document. Since a Draft EIS under SEPA was already published, the document served as a Draft EIS under NEPA and a Draft Supplemental EIS under SEPA, referred to as the Draft EIS herein. FTA is the lead federal agency under NEPA, while Sound Transit is the lead agency under SEPA. This report is an appendix to the Final EIS.

In support of the project, Parametrix and HDR Engineering, Inc., under contract to the Sound Transit, contracted with Aqua Terra Cultural Resource Consultants (ATCRC) and Historic Research Associates, Inc. (HRA), who jointly provided cultural resources services for the project. Project tasks included the preparation of a methods memo and a Cultural Resources Survey Plan, which were reviewed by the State Historic Preservation Officer (SHPO) and coordinating tribes. These tribes consist of the Puyallup Tribe of the Puyallup Reservation (Puyallup Tribe of Indians), the Muckleshoot Indian Tribe, the Nisqually Indian Tribe, and the Confederated Tribes and Bands of the Yakama Nation. This report includes the results of background review, field investigation, and the evaluation of identified archaeological and historic-period, built-environment resources within the Area of Potential Effects (APE) for each alternative.

The results of the cultural resource investigations were used to inform the alternatives analysis for historic and archaeological resources in the 2021 SEPA Draft EIS. Resources that were constructed in 1985 or earlier were included in the built-environment survey and inventory. For the 2021 SEPA Draft EIS Sound Transit evaluated 86 historic-period, built-environment resources for National Register of Historic Places (NRHP) eligibility and coordinated with staff from the Washington State Department of Archaeology and Historic Preservation (DAHP) to assess NRHP eligibility of the built-environment resources. Through this coordination, it was determined that none of the resources evaluated by Sound Transit were eligible for listing in the NRHP.

The project is receiving funding from the FTA and is defined as a federal undertaking. As such, the project must comply with Section 106 of the National Historic Preservation Act (NHPA); see additional discussion in Section 1.2 below. This technical report uses the research and reporting prepared for the 2021 SEPA Draft EIS and updates the regulatory context to meet the requirements of Section 106. On July 20, 2023, FTA initiated Section 106 consultation and requested comments on the APE with SHPO and the Muckleshoot Indian Tribe, Nisqually Indian Tribe, Puyallup Tribe of Indians, Snoqualmie Indian Tribe, Suquamish Indian Tribe of the Port Madison Reservation, Squaxin Island Tribe of the Squaxin Island Reservation, and Confederated Tribes and Bands of the Yakama Nation. SHPO concurred with the APE on July 24, 2023. In October 2023, FTA determined, and SHPO concurred, that the project would have no adverse effect to resources listed on or eligible for the NRHP (See Attachment G4-6, Tribal and Agency Correspondence).

In support of this Historical and Archaeological Resources Technical Report, additional information can be found in Attachments G4-1 through G4-7.

1.1 Project Description

Sound Transit proposes to construct and operate an operations and maintenance facility in its South Corridor (OMF South) to meet agency needs for an expanded fleet of light rail vehicles (LRVs). The need to expand LRV maintenance capacity was identified in Sound Transit 3: The Regional Transit System Plan for Central Puget Sound (Sound Transit 3). OMF South would be used to store, maintain, and deploy approximately 144 LRVs for daily service. It would provide facilities for vehicle storage, inspections, maintenance and repair, interior vehicle cleaning, and exterior vehicle washing. Additionally, the facility would receive, test, and commission new LRVs for the entire light rail system.

OMF South would also be used to accommodate administrative and operational functions, such as serving as a report base for LRV operators. Included is a Maintenance of Way (MOW) building for maintenance and storage of spare parts for tracks, vehicle propulsion equipment, train signals, and other infrastructure, in addition to storage facilities for the entire Link system. Other facility elements would include employee and visitor parking, operations staff offices, maintenance staff offices, dispatcher work stations, an employee report room, and areas with lockers, showers, and restrooms for both operators and maintenance personnel.

Three site alternatives for the proposed project are evaluated in the Final EIS along with a No Build Alternative. The Preferred Alternative is shown in Figure G4.1-2, the South 344th Street Alternative is shown in Figure G4.1-3, and the Midway Landfill Alternative is shown in Figure G4.1-4.

OMF South would need to have tracks connecting to a light rail line that will be operating when the facility is planned to open, which in southern King County is the Federal Way Link Extension (FWLE). The length and location of these connecting tracks varies by alternative. The Preferred Alternative would require the construction of approximately 1.4 miles of mainline tracks and the South 344th Street Alternative would require approximately 1.8 miles of mainline tracks. The Midway Landfill Alternative is adjacent to FWLE and would connect by lead tracks directly to the FWLE mainline tracks. The Preferred and South 344th Street alternative mainlines include tail tracks that extend approximately 1,000 feet past the site to allow trains to turnaround and access the site from the south if the northern lead tracks were out of service.

The Preferred and South 344th Street alternative would also include a test track to prepare new vehicles for service. The test track would run east of and parallel to the mainline connecting the sites to FWLE (Figure G4.1-2 and G4.1-4). Figure G4.1-5 shows the mainline track options. The Midway Landfill Alternative would not include a test track because the varying grades of the existing mainline tracks make it infeasible. Due to this, this analysis assumes that LRV testing would occur on the mainline tracks.

In addition to the features identified above, the Preferred Alternative includes the extension of 18th Place S between S 340th Street and S 336th Street to replace the functions of 20th Avenue S, which would be vacated, and the extension of 21st Ave S south to S 344th Street to meet Federal Way code requirements.

1.2 Purpose of the Report

HRA and ATCRC prepared this cultural resources technical report documenting the findings of architectural and archaeological survey and inventory investigations within the defined APE for the project.

1.3 Key Personnel

Cultural resources inventory, survey work, and NRHP evaluations were performed by the consultants identified in Table G4.1-1. This document refers to this work as being conducted by Sound Transit and the NRHP eligibility recommendations as Sound Transit's recommendations.

Table G4.1-1 Key Personnel

Name	Qualifications	Roles and Responsibilities
Ron Adams, RPA	Master of Archaeology, PhD Archaeology, Senior Archaeologist	Principal Investigator, Archaeologist, Historical Research Associates, Inc.
Sarah Amell, RPA	Master of Maritime Archaeology, Principal Archaeologist	Project Manager for Archaeology Field Staff, Aqua Terra Cultural Resources Consultants
Andrew Viloudaki, M.A	Master of Anthropology, Project Archaeologist	Principal Investigator, Archaeologist, Aqua Terra Cultural Resources Consultants
Natalie Perrin	Master of Historic Preservation, Principal Architectural Historian	Architectural Historian, Historical Research Associates
Chrisanne Beckner	Master of Historic Preservation, Senior Architectural Historian	Principal Investigator and Architectural Historian, Historical Research Associates
Brent Hicks, MA, RPA	Master of Archaeology, Principal Archaeologist	Project Manager, Historical Research Associates
Michele Punke, RPA	Master of Anthropology/Geosciences, PhD Physical Geography, Senior Archaeologist and Geoarchaeologist	Principal Geoarchaeologist

HRA conducted the built-environment survey for the project. HRA Principal Investigator Chrisanne Beckner, MS, who meets the Secretary of the Interior's professional qualification standards for architectural history, conducted a field survey for the project and authored sections of this report in partnership with Natalie Perrin, HRA's principal architectural historian.

HRA, supported by an ATCRC field crew, conducted the near-surface archaeological inventory and survey for the project. HRA archaeologist Ron Adams led a field team and compiled sections of this report under project manager Brent Hicks. The ATCRC team conducted the near-surface archaeological inventory for the project and compiled sections of this report under project manager Sarah Amell.

1.4 Regulatory Context

OMF South must comply with multiple federal, state, and local environmental laws, regulations, and policies for environmental review. A brief discussion of these and their consideration of cultural resources is presented below.

FTA is the lead agency under NEPA. Under NEPA, cultural resources encompass a wide range of resources including, but not limited to, sacred sites, archaeological and built-environment resources not eligible for the NRHP, archaeological and built-environment resources eligible for the NRHP, and archaeological collections.

As federal funding is anticipated and the project is defined as a federal undertaking, it is subject to compliance with Section 106 of the NHPA, as amended, codified in 54 U.S. Code § 300101 et seq. Implementing regulations for Section 106 compliance are described in 36 Code of Federal Regulations (CFR) Part 800. Section 106 requires that federal agencies account for the effects of their undertakings on historic properties. A historic property is typically aged 50 years or older and is defined in 36 CFR § 800.16(l)(1) as follows:

> … any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization and that meet the National Register criteria.

Regulations at 36 CFR Part 800 require the federal agency involved in the undertaking to identify the APE, conduct an inventory of historic properties that may be located within the APE, determine whether any of the historic properties identified are eligible for listing in the NRHP, and determine whether NRHP-eligible properties will be affected by the undertaking. An APE is defined in 36 CFR § 800.16(d) as follows:

> … the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist. The APE is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking …

In addition to Section 106, Section 4(f) of the U.S. Department of Transportation Act of 1966 (49 U.S. Code § 303[c]) is triggered by funding or approval from a federal agency for a project that proposes “use” of historic property. A determination of adverse effect under Section 106 generally constitutes a use under Section 4(f).

The project must also comply with SEPA. Sound Transit is the lead agency for SEPA compliance. The project is subject to other Washington state laws that address the protection of archaeological sites and Native American burials. For example, the Archaeological Sites and Resources Protection Act (Revised Code of Washington [RCW] 27.53), prohibits disturbance of known precontact and historic archaeological sites on public or private lands. The Indian Graves and Records Act (RCW 27.44) prohibits disturbance of Native American graves and provides that inadvertent disturbance through construction or other activity requires reinternment under supervision of the appropriate tribes.

Certified Local Governments are considered the experts on whether resources meet the criteria for local listing in city or county preservation registers. Consulting parties, including SHPO, provide expert opinions on whether a proposed project has the potential to adversely impact cultural resources.

The King County Register of Historic Places (KCRHP) is a Certified Local Government and has a different timeline: a historic, built-environment resource may be designated as a King County Landmark if it is more than 40 years old or, in the case of a landmark district, contains resources that are more than 40 years old. This differs from NRHP, which requires that a property be at least 50 years old unless it is exceptionally important. The King County Landmark eligibility recommendations here are based on review of the King County Landmarks Commission ordinance (King County Code Chapter 20.62; King County Policy LUD 16-1 [AEP]). The cities of Federal Way and Kent have both adopted this section of the King County Code concerning the protection and preservation of landmarks.

Other local regulations that were reviewed during the assessment included the following:

- City of Federal Way Code Chapter 19.285, Protection and Preservation of Landmarks, which adopts King County Code Chapter 20.26.
- Kent City Code Chapter 14.12, Landmark Designation and Preservation, which adopts King County Code Chapter 20.26, under Ordinance No. 3809.

1.4.1 NRHP Requirements for Listing

1.4.1.1 Criteria for Significance

To be eligible for listing in the NRHP, a resource must meet one of four criteria for significance and possess sufficient integrity to express its significance (NPS 1995).

Sound Transit evaluates resources using the following guidelines established by the National Park Service. To be individually eligible for listing in the NRHP, a property must be significant under one of the following criteria:

- Criterion A: Under Criterion A, properties can be determined eligible for listing in the NRHP if they are associated with events that have made a significant contribution to the broad patterns of our history.
- Criterion B: Under Criterion B, properties can be determined eligible for listing in the NRHP if they are associated with the lives of persons significant in our past (i.e., persons whose activities are demonstrably important within a local, state, or national context).
- Criterion C: Under Criterion C, properties can be determined eligible for listing in the NRHP if they embody the distinctive characteristics of a type, period, or method of construction, represent the works of a master, or possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., are part of a district). Discrete features, a particular building for example, may best be documented under this Criterion, though collections of resources may also have significance under Criterion C for architecture or engineering association.
- Criterion D: Under Criterion D, properties may be eligible for the NRHP if they have yielded, or may be likely to yield, information important in history. To be eligible under Criterion D, the property must have, or have had, information to contribute to our understanding of human history and that information must be considered “important” (NPS 1997). Most commonly applied to archaeological sites, buildings, structures, and objects may be eligible under Criterion D if they are the principal source of information.

1.4.1.2 Integrity

Integrity is the ability of a property to convey its significance. To be eligible for the NRHP, a property must not only be shown to be significant under NRHP criteria (A through D above), but it must also have integrity. The evaluation of integrity is grounded in an understanding of a property's physical features and how they relate to its significance. Historic properties either retain integrity (that is, convey their significance) or they do not. To retain integrity, a property will always possess several, and usually most, of the seven aspects of integrity, which are:

- Location. Location is the place where the historic property was constructed or the place where the historic event occurred.
- Design. Design is the combination of elements that create the form, plan, space, structure, and style of a property.
- Setting. Setting is the physical environment of a historic property.
- Materials. Materials are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.
- Workmanship. Workmanship is the physical evidence of crafts of a particular culture or people during any given period in history or prehistory.
- Feeling. Feeling is the property's expression of the aesthetic or historic sense of a particular period of time.
- Association. Association is the direct link between an important historic event or person and a historic property (NPS 1995).

1.4.2 Additional Historic Register Criteria for Listing

Under Section 106 of the NHPA, the project proponent is required to consider the effects the project might have on NRHP-eligible or listed resources. Eligibility for listing in state or local preservation registers is not considered. However, as the project passes through multiple local jurisdictions, Sound Transit has considered whether resources within the APE could qualify for state or local listing. Sound Transit has provided supplemental recommendations regarding each surveyed resource's eligibility for listing in the Washington Heritage Register (WHR) and King County Register of Historic Places, as appropriate. These recommendations for state and local listing are advisory only.

1.4.2.1 Washington Heritage Register

To be individually eligible for listing in the WHR, a property must be significant within a historic context. Sites which are listed in the NRHP are automatically added to the WHR (25-12 Washington Administrative Code [WAC]). As such, a separate nomination is not needed and, for the purposes of this report, the same four criteria utilized for the NRHP (A through D above) are used herein to evaluate for eligibility for listing in the WHR (DAHP 2020d).

1.4.2.2 King County Register of Historic Places

The KCRHP is a list of King County Landmarks. To be designated a King County Landmark (eligible for listing on the KCRHP), a resource must be over 40 years old or contain resources that are more than 40 years old that possess integrity of location, design, setting, materials, workmanship, feeling, or association, and meet one or more of the following criteria, which are based on NRHP eligibility criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of local, state, or national history; or
2. Is associated with the lives of persons significant in local, state, or national history; or
3. Embodies the distinctive characteristics of a type, period, style or method of design or construction, or that represents a significant and distinguishable entity whose components may lack individual distinction; or
4. Has yielded, or may be likely to yield, information important to prehistory or history; or
5. Is an outstanding work of a designer or builder who has made a substantial contribution to the art (KC 20.62.040).

1.5 Agency and Tribal Coordination

Several federal statutes require federal agencies to consult or coordinate with Native American Indian tribes. Key federal historic preservation and cultural resource protection statutes that require agencies to consult with tribes or accommodate tribal views and practices are summarized below:

- **The National Historic Preservation Act of 1966** (NHPA), as amended, is the basis for tribal consultation in the Section 106 review process. In particular:
    - Section 101(d)(6)(A) states that properties of religious and cultural significance to Indian tribes may be eligible for listing in the National Register of Historic Places.
    - Section 101(d)(6)(B) requires that federal agencies consult with any Indian tribe that attaches religious and cultural significance to historic properties that may be affected by an undertaking.
- **The National Environmental Policy Act of 1969** (NEPA) contains language in the Council on Environmental Quality regulations mandating federal agencies to contact tribes and provide opportunities to participate in the preparation of an environmental assessment or EIS.
- **The American Indian Religious Freedom Act of 1978** contains language establishing federal government policies to protect the right of American Indians to exercise their traditional religions, ceremonials, and traditional rights including access to sites and the use and possession of sacred objects.
- **The Native American Graves Protection and Repatriation Act of 1990** directs federal agencies to consult with Indian tribes prior to removal or excavation of Native American human remains on federally managed lands.
- **Executive Order 13175**, Consultation and Coordination with Indian Tribal Governments (2000) directs federal agencies to consider tribal government, sovereignty, rights, and responsibilities whenever policies are formulated that significantly affect tribal governments.
- **Section 4(f), Department of Transportation Act of 1966**, generally prohibits U.S. Department of Transportation agencies, including FTA, from approving projects that would use certain types of property, including traditional cultural properties.

Coordination with agencies and Tribes is ongoing. Both the Puyallup Tribe of Indians and the Muckleshoot Indian Tribe have representatives on Sound Transit's OMF South Interagency Group. The Cultural Resources Survey Plan, which supported the 2021 SEPA Draft EIS, was provided to the Muckleshoot Indian Tribe, Nisqually Indian Tribe, Puyallup Tribe of Indians, and Confederated Tribes and Bands of the Yakama Nation as well as SHPO for review on January 13, 2020. No formal comments were received on the Cultural Resources Survey Plan from Tribes or SHPO.

On July 20, 2023, FTA initiated Section 106 consultation and requested comments on the APE in letters to the Muckleshoot Indian Tribe, Nisqually Indian Tribe, Puyallup Tribe of the Puyallup Reservation, Snoqualmie Indian Tribe, Suquamish Indian Tribe of the Port Madison Reservation, Squaxin Island Tribe of the Squaxin Island Reservation, Confederated Tribes and Bands of the Yakama Nation, and SHPO. On October 27, 2023, FTA determined that the project would have no adverse effect to resources listed on or eligible for the National Register of Historic Places. The SHPO concurred with FTA's determination on October 31, 2023.

Table G4.1-2 lists the correspondence with Tribes and SHPO for OMF South between January 2020 and November 2023, which are included in Attachment G4-6, Tribal and Agency Correspondence. Recent Section 4(f) correspondence is included in Appendix F, Section 4(f) Evaluation.

1.6 Area of Potential Effects

FTA has defined the APE in consultation with SHPO and affected Tribes. This consultation included a cultural resources inventory plan. The APE for OMF South (Figures G4.1-6 through G4.1-8) generally extends from the project elements (e.g., guideway, station locations, construction staging areas, and utility improvement and expansion areas) to the nearest tax parcel or a maximum of 200 feet where large tax parcels are adjacent to project elements.

The APE for a project defines the boundary within which the project has the potential to impact cultural resources. The APE includes all project elements and areas extending from the project elements, such as connecting tracks and construction staging areas, to the nearest tax parcel or a maximum of 200 feet where large tax parcels are adjacent to project elements.

Both the Preferred and South 344th Street alternatives are located in Sections 16 and 21 of Township 21 North, Range 4 East (Figure G4.1-6, and Figure G4.1-7, respectively). The Midway Landfill Alternative is located in Sections 21 and 22 of Township 22 North, Range 4 East (Figure G4.1-8).

The vertical impacts of the project are varied across the proposed alternatives and the alternative designs. All details have not been finalized; however, basic aspects of the design have been completed for most alternatives to provide estimated height ranges for project elements. The expected depths of effect vary greatly throughout the APE due to area-specific soil and geological conditions.

The general estimated depths of impact for construction at the Preferred and South 344th Street alternatives is a minimum of 2 feet below ground surface (fbgs) to remove top soil before fill is added to the sites for stabilization, with maximum cuts of approximately 8 fbgs for the Preferred Alternative and approximately 18 fbgs for the South 344th Street Alternative anticipated during site levelling activities. The estimated depths of impact for the Midway Landfill alternative include either partially excavated cut platforms to a depth of 10 feet below ground surface (fbgs) with drilled column supports to a depth of 120 to 180 fbgs or complete excavation of the landfill.

The depths of impact for the columns supporting the elevated elements of the mainline tracks between the Federal Way Downtown Station and the Preferred and South 344th Street alternatives range from 60 to 90 fbgs.

2 PREVIOUS CULTURAL RESOURCE STUDIES AND RESULTS

The initial electronic record search for the APE was limited to records housed in the DAHP Washington Information System for Architectural and Archaeological Records Data (WISAARD). WISAARD includes archaeological site and isolate records, cultural resource assessments, NRHP nomination forms, historic property inventory (HPI) forms, and other publicly restricted cultural resources data. ATCRC and HRA searched the WISAARD database for the location of any cultural resources within 1 mile of the APE for each alternative. Additionally, ATCRC and HRA reviewed the King County Register of Historic Places to identify any locally listed resources within 1 mile of the APE for each alternative.

In October 2019, ATCRC and HRA supplemented the information obtained from the DAHP database with publicly accessible data, such as tax parcel records, historic area maps, Sanborn Fire Insurance Maps, the King County Map Vault, and General Lands Office (GLO) maps in order to develop a better understanding of the land-use patterns of the area. This initial background assessment was updated for the 2023 Draft EIS. These record reviews were undertaken to ascertain the presence or absence of any previously documented archaeological resources, traditional cultural places, and built-environment resources that may reside within the APE.

The DAHP Statewide Predictive Model indicates that the APE intersects areas that are at varying risk for encountering precontact cultural resources ranging from very low to moderate, with the highest risk areas for precontact and historic-period archaeological sites found within the section of the Preferred and South 344th Street alternatives where the mainline track is proposed.

The results of these record searches are presented for each of the APE below.

2.1 Preferred Alternative

The Preferred Alternative is located in Federal Way. The alternative begins with a mainline track leading from the Federal Way Downtown Station south along the western boundary of I-5 to the proposed OMF South location at the present Christian Faith Center, which extends south into an area of residential and light industry properties (Figures G4.1-5). A test track would run parallel to the east side of the mainline from S 324th Street to just south of S 336th Street. Note that the location overlaps with the South 344th Street Alternative APE, leading to similar background research results (Figure G4.1-6).

2.1.1 Cultural Resources Surveys

Prior to the commencement of the field surveys for the 2021 SEPA Draft EIS, a Cultural Resources Survey Plan was prepared for review by the Puyallup Tribe of Indians, Muckleshoot Indian Tribe, Nisqually Indian Tribe, the Confederated Tribes and Bands of the Yakama Nation, and SHPO. This plan was distributed to the aforementioned Tribes by Sound Transit under its authority as lead agency for SEPA. No formal comments were received from Tribes or SHPO.

The field survey included a historic-period, built-environment resources survey and inventory for previously undocumented or unevaluated buildings, structures, and objects constructed in 1985 or earlier, as well as an archaeological survey that included pedestrian transects and subsurface archaeological investigations (shovel probes and hand auger cores).

There have been at least 14 other previous cultural resource assessments conducted within 1 mile of the Preferred Alternative APE, five of which were conducted in response to infrastructure improvement projects (Table G4.2-1). None of these surveys identified any cultural resources within the APE.

Table G4.2-1 Cultural Resource Surveys Conducted within a 1-Mile Radius of the Preferred Alternative

Source	Title	Proximity to APE and Direction	Cultural Resources Identified within APE
Larson Anthropological Archaeological Services Limited (2000a)	Regional Express/Federal Way and Star Lake Project Cultural Resource Assessment Federal Way Alternative	Within	None

Elliott, Chidley, and Sterner (2020)	Draft: Federal Way Link Extension, Additional Cultural Resources Inventory, King County Washington	0.50 mile north	None

2.1.2 Ethnographic Places

There are no known Tribal villages within 1 mile of any of the project alternatives. However, there are several places within 1 mile that have historic and mythical links to Native American populations. Both "*Biskwa'd1s*" (Steel Lake) and "*B1skwa'dis*" (Lake Doloff) are approximately 0.95 to 1 mile north of the APE. One additional ethnographic place, *Tso'Lkob1d*, is linked to Steel Lake by mythology (Table G4.2-2).

Table G4.2-2 Recorded Ethnographic Places within a 1-Mile Radius of the Preferred Alternative Area of Potential Effect

Location	Ethnographer s Orthography	Ethnographer s Translation/Description	Source
Steel Lake	*Biskwa'd1s*	Where there are whales, the name refers to the story recounted regarding *Tso'Lkab1d*.	Hilbert et al. 2001
Lake Doloff	*B1skwa'dis*	Where there are whales, source of Mill Creek.	Hilbert et al. 2001

2.1.3 Archaeological Sites

Two historical archaeological sites (45KI719 and 45KI1481) are located within a 1-mile radius of the APE. Site 45KI719 was a historic-period building foundation located within the area of direct impacts for the Preferred Alternative APE. The site was determined not eligible for listing in the NRHP and subsequently removed by WSDOT during construction associated with I-5 improvements (DAHP 2005; Bartoy 2013). Site 45KI1481 consists of a series of historical roads related to residential development, built between 1935 and the 1950s, that was later partially demolished. It is potentially eligible for listing in the NRHP but has not been evaluated (Colon 2020). Site 45KI1481 is located approximately 0.4 mile east of the Preferred Alternative APE.

2.1.4 NRHP-Listed or Eligible Historic, Built-Environment Properties

There are no NRHP-listed resources within 1 mile of the Preferred Alternative APE.

According to DAHP's WISAARD database, there are two historic, built-environment properties determined to be eligible for the NRHP within 1-mile of the APE: the Calvary Lutheran Church and the Weyerhaeuser Headquarters (DAHP 2020b). Neither of these resources are located within the APE.

In addition, the Bonneville Power Association (BPA) conducted its own Section 106 consultation with SHPO in 2020 for the relocation of electrical transmission towers that would be impacted by the OMF South Project. These towers included those along the Tacoma-Covington Nos. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines. BPA determined that the transmission lines were eligible for listing in the NRHP.

2.1.5 King County Landmarks

There are no King County Landmarks within 1 mile of the Preferred Alternative APE.

2.1.6 Historic Maps and Aerial Photographs

The Preferred Alternative APE has been extensively disturbed from the beginning of Euro-American habitation of the area when it was logged and possibly farmed.[1] This initial disturbance likely occurred following the land sales from the NPRC, which was granted the land patents to most of Section 21, Township 21 North, Range 4 East (WA004720 [1895] and WA 060199 [GLO 1894]). The lands were then sold by the NPRC in a variety of lot sizes that would promptly change hands as individual fortunes rose and fell. Over 90 percent of the APE for this alternative is located within the northwest quadrant of Section 21. The landscape history following initial land sales indicates a general dereliction of the lands within the APE, likely in favor of forestry-related endeavors given the substandard soil conditions. Initial settlements within the area began to the west and north of the APE (USGS 1897a, USGS 1897b, USGS 1900).

Development within the APE was relatively minimal prior to World War II (Attachment G4-1; King County Map Vault 1936/1937a and 1936/1937c; United States War Department 1944). Development began to intensify in the APE by 1949 with the installation of the Bonneville Power Administration (BPA) power line between 1935 and 1949, and residential development along the northern boundary (South 320th Street), the western boundary along SR 99, the central boundary of the OMF alternative at South 336th Street, and the southern edge of the APE along South 336th Place (Attachment G4-1; USGS 1949,1957,1961).

Residential and commercial development slowly expanded along these corridors through the 1950s and early 1960s (Attachment G4-1; USGS 1957 and 1961). Residential, commercial, and light industrial development within the APE accelerated following the completion of I-5 through the area in 1963, which shifted historic development patterns from SR 99 to locations with easy access to I-5 (Attachment G4-1; King County Map Vault 1965a and 1965b; USGS 1962–1968 and 1969–1972). The extensive modern land clearance and development currently in evidence within the APE did not occur until 2005 with the construction of the Christian Faith Center (Google Earth 2019).

2.2 South 344th Street Alternative

The South 344th Street Alternative is located in Federal Way. The alternative begins with a mainline track leading from the Federal Way Downtown Station south along the western boundary of I-5 to each alternative location (Figures G4.1-5). A test track would run parallel to the east side of the mainline from S 324th Street to just south of S 336th Street. The South 344th Street Alternative would be located at the east of the present Christian Faith Center, overlapping the Preferred Alternative and extending south into an area of residential and light industry properties (Figure G4.1-7). Note that the location overlaps with the Preferred Alternative APE, leading to similar background research results.

2.2.1 Cultural Resources Surveys

There have been at least 15 previous cultural resource assessments conducted within 1 mile of the South 344th Street APE, 11 of which were conducted in response to infrastructure improvement projects (Table G4.2-3). One of these surveys identified a cultural resource, 45KI1719, within the APE.

---

[1] Due to the extensive overlap between the Preferred and South 344th Street alternatives, portions of the Historic Maps and Aerial Photograph Sections are repetitive.

Table G4.2-3 Cultural Resource Surveys Conducted within a 1-Mile Radius of the South 344th Street Alternative

Source	Title	Proximity to APE and direction	Cultural Resources Identified within APE

2.2.2 Ethnographic Places

There are no known Tribal villages within 1 mile of any of the project alternatives. However, there are several places that have historic and mythical links to Native American populations. Both "*Biskwa'd1s*" (Steel Lake) and "*B1skwa'dis*" (Lake Doloff) are approximately 0.95 to 1 mile away north of the APE. One additional ethnographic place, *Tso'Lkob1d*, is linked to Steel Lake by mythology (Table G4.2-4).

Table G4.2-4 Recorded Ethnographic Places within a 1-Mile Radius of the South 344th Street Alternative Area of Potential Effects

Location	Ethnographer s Orthography	Ethnographer s Translation/Description	Source
Steel Lake	*Biskwa'd1s*	Where there are whales, the name refers to the story recounted regarding *Tso'Lkab1d*.	Hilbert et al. 2001
Lake Doloff	*B1skwa'dis*	Where there are whales, source of Mill Creek.	Hilbert et al. 2001

2.2.3 Archaeological Sites

Two historical archaeological sites (45KI719 and 45KI1481) are located within a 1-mile radius of the APE. Archaeological site 45KI719 is located within the southern section of the APE within the southern mainline section. The site consisted of a historic building foundation that has been determined not eligible for listing in the NRHP and was subsequently removed by WSDOT during construction associated with I-5 improvements (DAHP 2005; Bartoy 2013). Site 45KI1481 consists of a series of historic-period roads related to residential development, built between 1935 and the 1950s, that was later partially demolished. Site 45KI1481 has been determined potentially eligible for listing in the NRHP (Colon 2020). Site 45KI1481 is located approximately 0.4 mile east of the South 344th Street Alternative APE.

2.2.4 NRHP-Eligible or Listed Historic, Built-Environment Properties

There are no NRHP-listed resources within 1 mile of the South 344th Street Alternative APE.

According to DAHP's WISAARD database, there are three historic, built-environment properties within 1 mile of the APE that have been determined eligible for the NRHP. The People's National Bank, Calvary Lutheran Church, and the Weyerhaeuser Headquarters building (DAHP 2020b). None of these are located within the South 344th Street APE.

2.2.5 King County Landmarks

There are no King County Landmarks within 1 mile of the APE for the South 344th Street APE.

2.2.6 Historic Maps and Aerial Photographs

The South 344th Street APE has been extensively disturbed from the beginning of Euro-American habitation of the area when it was logged and possibly farmed.[2] This initial disturbance likely occurred following the land sales from the NPRC, which was granted the land patents to most of Section 21, Township 21 North, Range 4 East (WA004720 [1895] and WA 060199 [1894]). The lands were then sold in a variety of lot sizes that promptly changed hands as individual fortunes rose and fell. Over 90 percent of the APE is located within the northwest quadrant of Section 21. The landscape history following initial land sales indicates a general dereliction of the lands within the APE, likely in favor of forestry-related endeavors given substandard soil conditions. Initial settlements within the area began to the west and north of the APE (USGS 1897a, USGS 1897b, USGS 1900).

---

[2] Due to the extensive overlap between the Preferred and South 344th Street alternatives, portions of the Historic Maps and Aerial Photograph Sections are repetitive.

Development within the APE was relatively minimal prior to World War II (Attachment G4-1; United States War Department 1944). Development began to intensify in the APE by 1949 with the installation of the BPA power line between 1935 and 1949 (Attachment G4-1), and residential development along the northern boundary (South 320th Street), the western boundary along SR 99, South 341st Place, and South 344th Street (Attachment G4-1; USGS 1949,1957,1961).

Residential and commercial development slowly expanded along these roadways through the 1950s and early 1960s (Attachment G4-1; USGS 1957 and 1961). Residential, commercial, and light industrial development accelerated within the APE following the completion of I-5 through the area in 1963, although the development shifted from historic development patterns around SR 99 and South 344th Street to locations with easy access to I-5, particularly South 320th Street and South 348th Street (Attachment G4-1; King County Map Vault 1965a and 1965b; USGS 1962–1968 and 1969–1972). The extensive modern land clearance and development currently in evidence within the APE did not occur until the 1980s (Attachment G4-1; USGS 1981–1991).

2.3 Midway Landfill Alternative

The Midway Landfill Alternative is located in the Kent, south of S 246th Street, west of I-5, and is situated on the capped Midway Landfill at 24808 Pacific Highway S (Figures G4.1-8).

2.3.1 Cultural Resources Surveys

There have been at least 14 previous cultural resources surveys conducted within 1 mile of the APE for the Midway Landfill (Table G4.2-5). One ineligible cultural resource, 45KI1476, was documented within the APE.

Table G4.2-5 Cultural Resource Surveys Conducted within a 1-Mile Radius of the Midway Landfill Alternative

Source	Title	Proximity to APE and Direction	Cultural Resources Identified within APE
Larson Anthropological Archaeological Services Limited (2000b)	Regional Express/ Federal Way and Star Lake Project Cultural Resource Assessment Star Lake Alternative	1 mile South	None
Iversen et al. (2001)	Pacific Highway South HOV Lanes Cultural Resources Assessment	Adjacent	None
Rooke (2002)	Letter Report: Procedures and Results of a Cultural Resources Survey of Cingular Wireless Tower Site WA-645 (Lake Fenwick)	0.65 mile SE	None
Scott (2008)	Historic Resources Survey and Inventory, Kent	Within	None
Mishkar et al. (2009)	North Twin Bridge Assessment, Des Moines	0.8 mile West	None
Goodwin (2014)	Archaeological Survey for the Proposed SC1996 Midway South Telecommunications Facility	0.3 mile East	None

Table G4.2-5 Cultural Resource Surveys Conducted within a 1-Mile Radius of the Midway Landfill Alternative (continued)

Source	Title	Proximity to APE and Direction	Cultural Resources Identified within APE
Chambers and Amell (2014)	Cultural Resources Assessment for the Saltwater State Park Bridge Rehabilitation Project, Des Moines	1 mile West	None
Mather and Arthur (2015)	Archaeological Survey and Assessment of the Proposed Lakeridge Highline View Estates Subdivision (TPN 6929603575), Des Moines	0.55 mile NW	None
HDR Engineering, Inc. and CH2M Hill (2016)	Federal Way Link Extension: Historical and Archaeological Technical Report	Overlaps	None
Artifacts Consulting, Inc. (2016)	Highline College, Cultural Resources Survey	0.8 mile NW	None
Ives (2017)	Cultural Resources Survey for the WSDOT SR 509 SeaTac to I-5 Freeway Extension Project	Within	None
Hannum (2018)	Cultural Resources Assessment for the Zenith Park Site, King County, Washington	1 mile NW	None
Elliott, Chidley, and Sterner (2020)	Draft: Federal Way Link Extension, Additional Cultural Resources Inventory, King County Washington	Overlaps	45KI1476 (Not Eligible for NRHP)
Limberg et al. (2021)	SR 509/24th Avenue South to South 188th Street – New Expressway (SR 509 Stage 2) Project, King County, Washington	Adjacent	None

HOV = high occupancy vehicle; SR = State Route

2.3.2 Ethnographic Places

There are no known ethnographic Tribal villages within 1 mile of the APE. However, there are several places within 1 mile of the Midway Landfill Alternative APE that have historic and mythical links to Native American populations (Hilbert et al. 2001) (Table G4.2-6).

Table G4.2-6 Recorded Ethnographic Places within a 1-Mile Radius of the Midway Landfill Alternative Area of Potential Effects

Location	Ethnographer s Orthography	Ethnographer s Translation/Description	Source
McSorley Creek	*Tca'xgwEs*	A small creek halfway between Des Moines and Stone's Landing (Redondo).	Hilbert et al. 2001
Bank of the Green River	*Ctcagkq s*	Where a trail comes down a beach, a place on the west bank of the river, where a trail from Des Moines came over the ridge and down to the river.	Hilbert et al. 2001
Bank of the Green River	*t3ka'xwEts*	Crabapple trees / a flat in a bend in the river.	Hilbert et al. 2001
Bank of the Green River	*CugtLa'lgw1L*	Resembling a pathway; canoe trails / a side channel of the river above Henry McCabe's place.	Hilbert et al. 2001
Bank of the Green River	*bsskwEd*	Where there is a waterfall / a place formerly known as Langston's Ferry, there is also a fossil bed at this location	Hilbert et al. 2001

Note: Table is generally arranged from north to south.

2.3.3 Archaeological Sites

There is one archaeological site within this APE, the Midway Landfill (45KI1476), a landfill that was in use from 1966 to 1983. Site 45KI1476, the location of the Midway Landfill Alternative, has been determined not eligible for the NRHP by the FTA, with SHPO concurrence (DAHP 2020c).

The closest other recorded historic archaeological site (45KI208) is located approximately 1.05 miles east of the APE. The site is in the Green River Valley and consists of a broadly defined historical debris scatter and barn complex. The nearest precontact archaeological site (45KI436) is an inland shell midden located 1.35 miles west of the APE.

2.3.4 NRHP-Listed or Eligible Historic, Built-Environment Properties

There are no NRHP-listed resources within 1 mile of the Midway Landfill Alternative APE.

According to the WISAARD database, there are 24 historic, built-environment properties associated with the Highline College at 2400 S 240th Street in Des Moines, Washington, that were determined NRHP eligible by the Federal Aviation Administration (FAA) in 2013 (DAHP 2020b). Three other properties, two bridges, the North and South Twin Bridges and the State Park Log House are located within 1.0 mile of the APE and have formally been determined eligible for listing in the NRHP (DAHP 2020b). None of these resources are located within this APE.

2.3.5 King County Landmarks

There are no King County Landmarks within 1 mile of the APE for the Midway Landfill.

2.3.6 Historic Maps and Aerial Photographs

The Midway Alternative was extensively disturbed from the beginning of Euro-American habitation of the area when it was logged and possibly farmed. Initial large-scale landscape disturbance around the APE occurred between 1863 (GLO 1863) and 1897 (USGS 1897a, 1897b). The 1863 GLO maps indicate that the northwest quadrant of Section 21, Township 22 North, Range 4 East, was a prairie at that point in time (GLO 1863). It is unclear how densely forested the remainder of the section was prior to the land clearance identified in 1897 (USGS 1897a); however, all of the lands held by the Northern Pacific Railroad Company (NPRC) seem to have been managed in a similar manner.[3] The 1897 maps indicate that the APE is located within an area that was forested, then cleared by burning (whether before or after a harvest is unclear), and was in the process of being replanted (restocked) for timber harvesting at the time of the map preparation (USGS 1897a, 1897b).

The 1863 GLO maps do not identify any Native American or Euro-American features within the APE. The closest two features are both approximately 0.25 mile from the APE. The first is the state's Military Road from Seattle to Steilacoom to the east, and the second is a system of trails located north of the APE that trends east–west from the coast to the state's Military Road (GLO 1863).

---

[3] The NPRC held the patent for forested areas within Section 21 (Doc. 32, WAORAA 004720). This patent included the E ½, S ½ of the SW ¼, and the NE ¼ of the SW ¼, of Section 21, Township 22 North, Range 4 East.

The historic development of the area in and around the APE generally coincides with the further development of the transportation networks in the area. In 1897 (USGS 1897a), several homesteads are identified south and southeast of the APE, the closest being approximately 0.33 mile southeast on the intersection of the state's Military Road and what would become Reith Road South. Most development in the area was restricted to these travel corridors in the areas around the APE, until after the expansion and improvement of a dirt road across the western plateau (Kroll Map Company 1912, 1926). These expansions and improvements culminated with the completion of the White River Bypass (now SR 99) in 1928 (Seattle Times 1928).

Developments in the northwest, northeast, and southwest quadrants were subdivided and were undergoing annexation by the city of Des Moines by 1936 (Metsker 1936). The APE, in the southeast quadrant, was still owned by the Weyerhaeuser Timber Company. The developments surrounding the APE did not immediately manifest themselves as seen in 1936/1937 section aerial photographs published by King County (King County Map Vault 1936/1937b; Attachment G4-1). However, by 1957, substantial landscape changes are evident, with residential, commercial, and agricultural developments surrounding the Meade Sand and Gravel Company mine (Attachment G4-1; EarthExplorer 1957b).

3 NATURAL AND CULTURAL CONTEXT

As described in Section 2, ATCRC and HRA supplemented information obtained from DAHP's database with publicly accessible data. This background review assisted with identification of areas where context was necessary for the evaluation of the significance and NRHP eligibility of cultural resources identified with the APE per NEPA and 36 CFR 60.4 (NHPA 1966 as amended), Criteria for Evaluation, and in guidance provided in National Register Bulletin 15 (NPS 1995).

The following sections summarize the environmental, precontact, ethnographic, and historical contexts relevant to the Puget Sound region and provide the general project area setting. Following this section is a more specific history for each of the project areas of impact.

3.1 Environmental Context

The APE is located at the southern end of the Puget Lowland. The Puget Lowland is a physiographic province that was shaped by several periods of extensive glaciation during the late Pleistocene (Lasmanis 1991). The Vashon Stade of the Fraser Glaciation began around 18,000 years before present (BP) with an advance of the Cordilleran ice sheet into the lowlands (Porter and Swanson 1998). The Puget Lobe of the ice sheet flowed down into the Puget Lowland and reached its terminus just south of Olympia between 14,500 and 14,000 BP.

The Puget Lobe began to retreat shortly after reaching its terminus. Marine waters entered the lowlands that had been carved out by the glacier and filled Puget Sound. The remaining ice was floated and wasted away rapidly. Glaciomarine drift deposits were released from the melting glacial ice and deposited on the sea floor across the northern and central Puget Lowland, causing the land to rebound and relative sea levels to fall and expose glacial outwash deposits (Clague and James 2002). About 11,600 to 10,000 BP, the Cordilleran ice sheet advanced once again, leaving glacial till and outwash deposits in much of northwestern Washington (Easterbrook 2003). Sediments were deposited and often reworked as glaciers advanced and retreated, and glacial till and outwash deposits were left across much of the region at the end of the last glacial period (Snyder et al. 1973).

During the last Ice Age (the Pleistocene Epoch), the Puget Sound was covered by the thick Cordilleran ice sheet. In the last interval, known as the Fraser Glaciation, the Puget Lobe covered Puget Sound with up to 1,250 meters of ice (Thorson 1980). The Puget Lobe blocked north-flowing streams and created a system of proglacial lakes that were fed by ice-marginal and sub-glacial meltwater systems.

About 15,000 years ago, the Puget Lobe started to retreat northward toward Port Townsend, later retreating from what is now the Strait of Juan de Fuca. Remains of the glacial outwash plain, glacial moraines, kettle ponds, and old river terraces are still visible today and represent ground surfaces as old as 11,000 to 15,000 years. Lowlands formed as glacial outwash channels to both the east and south of the APE (Forsman et al. 1998; Thorson 1980). The geological foundation for the APE is continental glacial till-drift, predominantly under gravelly sandy loams with urban land and minor elements of sandy loam (NRCS 2019; WaDGER 2016).

Precontact Period

The cultural history of the Pacific Northwest and Puget Sound region has great temporal depth and encompasses the earliest periods of human settlement of North America (e.g., Kopperl et al. 2015; Kopperl et al. 2016). Given the geologic information presented above and the age of the landforms within the APE, it is possible that archaeological sites dating throughout the period of known human occupation in the region could be encountered within the APE. In order to frame an understanding of the types of sites that may be anticipated (as discussed in Section 6 below), a generalized cultural chronology adapted from that of Matson and Coupland (2009) is presented below.

Earliest Cultures (14,000+ to 10,000 BP)

The earliest documented settlement in the Puget Sound region begins about 14,000 BP (Matson and Coupland 2009). During this period, humans were continually adapting to the region, which includes a dynamic landscape of glacial retreat as well as climatic and environmental change (Matson and Coupland 2009). Between about 14,000 and 10,000 BP, it has been hypothesized that there was a general continuity in settlement, subsistence, and technologies. Archaeological evidence from this period indicates that human social groups were probably small, highly mobile, and reliant on seasonally available resources across the landscape (Ames and Maschner 1999; Matson and Coupland 2009).

Traditionally, the earliest occupation recognized in North America and the Pacific Northwest has been the Clovis culture (12,000 to 11,000 BP) with its distinctive fluted projectile points (Matson and Coupland 2009). Clovis projectile points are widely distributed in the Puget Sound region, all of them surface finds (Croes et al. 2008). There is also growing evidence of an earlier, pre-Clovis occupation in the Northwest (e.g., Paisley caves in southeastern Oregon at 14,400 BP [Gilbert et al. 2008; Beck and Jones 2010, 2012]).

Several archaeological sites provide information about the earliest period of occupation in Washington. Remains found at the Manis mastodon site near Sequim, Washington, suggest humans hunted mastodon as early as 13,800 BP (Waters et al. 2011). The Ayer Pond bison remains from Orcas Island date to approximately 14,000 BP and include evidence of human butchering (Kenady et al. 2011). The Richey-Roberts site in Wenatchee, Washington, contained a large cache of Clovis points and bone rods dated to ca 13,000 to 12,000 BP (Kirk and Daugherty 2007). Within the Puget Sound lowlands, the Bear Creek site (45KI839) in Redmond, Washington, is the only example of a stratified site dating to this earliest period of human occupation. The site contains a large, flaked stone assemblage and includes both stemmed and concave base projectile points (Kopperl et al. 2015).

The Archaic (10,000 to 5,000 BP)

The Archaic period in the Puget Sound region is one with a few distinct types of archaeological sites. These distinct site types have led archaeologists to hypothesize that occupants of the region during this period continued to follow a highly mobile settlement pattern focused on terrestrial game supplemented by plant processing and use of aquatic environments to a lesser extent (Ames and Maschner 1999). Archaeological features and faunal remains from archaic period sites are rare but when they are found they seem to indicate a well-developed land-use strategy (Chatters et al. 2011).

Archaeological sites from this period are often characterized by the presence of larger laurel-leaf shaped blades/projectile points and are part of a tradition that goes by many regional names. In the Puget Sound region, this time period is often called the Cascade Phase (Matson and Coupland 2009), and localized material culture complex names like Olcott (Kidd 1964) fall into this phase. In addition to laurel-leaf-shaped bifaces, other flaked stone tools (e.g., cobble tools), blade cores, and flaking debris are commonly found in association at Cascade sites (Carlson 1990; Miss and Campbell 1991; Matson 1985; Morgan 1999). Most commonly, sites dating to this period, especially Olcott sites, are generally found in upland settings and on higher river terraces. The sites are likely resource procurement and processing camps focused on exploitation of upland game and wild plant foods, but subsistence adaptations for this period are poorly understood. Although faunal remains for sites dating to this period are rare, mammalian and fish remains have been reported (Chatters et al. 2011). What is known about subsistence and settlement patterns from this period comes from sites like Glenrose Cannery (DgRr6) site in British Columbia, the Dalles Roadcut site (35WS8) on the Columbia River, and the Granite Falls site (45SN303) in western Washington, among others (Chatters et al. 2011; Kopperl et al. 2016). In the Puget Sound, Olcott-style points have been reported in private collections throughout the region as well as inland areas of islands in the Puget Sound (Deppen et al. 2014; Taylor et al. 2009 and 2011). Lowland sites dating to this period include the Marymoor site (45KI9), and the DuPont Southwest site (45PI172), dating ca 6,000 BP and containing the earliest shell lenses in the Puget lowlands along with other tools and evidence of shellfish processing (Kopperl et al. 2016). These sites have components into the following phase that are discussed in the following section.

Development of Coastal Lifeways (5,000 to 3,500 BP)

After about 5,000 BP, archaeological evidence suggests that distinctive regional cultures developed with settlement and subsistence patterns that differ from those of the earlier adaptations in western Washington (Kopperl et al. 2016). Throughout this period, subsistence among Puget Sound groups becomes increasingly focused on marine resources, particularly shellfish and salmon, along with exploitation of a broad spectrum of other intertidal and upland subsistence resources. Shell middens become more common during this period, and these sites provide some of the best insights into shifting subsistence regimes. During this period, settlement patterns appear to become more intensive in localized areas, indicating reduced residential mobility (*sensu* Binford 1980) through time. New technologies are also present, among them ground stone tools and bone tools (Larson and Lewarch 1995; Ames and Maschner 1999; Matson and Coupland 2009). Western red cedar becomes a dominant tree in the region during this period, and wood-working adzes appear as early as 5,000 years ago, with evidence of canoe technology and construction of large plank houses by at least 2,000 to 3,000 years ago (Hebda and Matthews 1984; Donald 2003; Matson and Coupland 2009). With the rise in sea level during this period, earlier sites in coastal settings are likely to be submerged or have eroded away (Larson and Lewarch 1995; Kopperl et al. 2016).

Several previously excavated archaeological sites dating to this time period provide information relevant to the general history of the Puget Sound lowlands. The Marymoor site (45KI9), located near the juncture of the Sammamish River and Bear Creek in King County, has cultural deposits dating from approximately 6,000 to 1,500 BP. The artifact assemblage contains flaked stone tools, stone tool manufacture, and evidence of food processing dating to both this and the preceding period (Greengo 1966; Lockwood 2016). The DuPont Southwest site (45PI72) is on a bluff overlooking the Nisqually Reach in the south Puget Sound (Wessen 1969). The site was tested and contains flaked stone artifacts along with lenses of shell and other food remains, with the oldest calibrated radiocarbon date ranging from 6,180 to 5,930 BP and the most recent at 3,000 BP. The West Point sites, 45KI428 and 45KI29, in West Seattle are shell middens that have cultural deposits dating to this period. The cultural deposits at the site contain at least five distinct camping and food processing loci dating from 4,200 to 200 BP. Material remains included faunal bone, ground stone, and flaked stone tools, and subsistence remains include sea and terrestrial mammal remains, birds, fish, and shellfish (Larson and Lewarch 1995).The Bray site (45PI1276) located on a terrace above the White River near Sumner, Washington (Jolivette and Huber 2016) dates to approximately 3,800 to 2,500 BP and includes several earth ovens, an array of dart points, microblades, ground stone, and steatite beads. The earth ovens at the Bray site appear to be similar to those used to process camas bulbs in sites in eastern Washington; however, no evidence to support such use was found.

The Northwest Coast Cultural Pattern (3,500 to 1,500 BP)

Development of the Northwest Coast cultural pattern in the Puget lowlands (ca 3,500 to 1,500 BP) is marked by continued decrease in residential mobility and is accompanied by evidence of increased social complexity (e.g., Larson and Lewarch 1995). The majority of shell midden sites in the Puget Sound region date to this and, in part, to the preceding period (Taylor et al 2011). Residential stability and logistic settlement patterns are in evidence during this period and seen by increases in lowland and upland limited activity procurement sites associated with spring and summer fishing and root-gathering areas as well as specialized base camps and permanent or semi-permanent winter villages (Kopperl et al. 2016). The latter are associated with distinct longer-term community groupings, especially in the form of large multifamily plank houses. Social stratification is seen in the archaeological record of the region, through differentiation in burial practices and wealth item distribution (Ames and Maschner 1999; Lewarch and Larson 1995).

Also distinctive from the previous period is the marked degree of subsistence intensification as shown by the presence of large-scale fish harvesting technologies (nets and weirs), large-scale storage of salmon, and winter storage of shellfish. Village sites are widely distributed in all coastal areas of Puget Sound (Nelson 1990; Ames and Maschner 1999; Matson and Coupland 2009). Fish weirs and other constructed features are often found in association with large village sites. Common artifact assemblages consist of a range of hunting, fishing, and food processing tools; bone and shell implements; and dense midden deposits. By the end of the period, wide similarities to ethnographically described contact-period cultures in the Puget Sound lowlands are evident (Ames and Maschner 1999; Matson and Coupland 2009). The Marymoor site (45KI9) has cultural deposits dated at 2,500 BP. The long-term occupations at West Point (45KI428 and 45KI29) in King County and the Bray site in Pierce County (45PI1276) contain cultural deposits that extend into this period and provide settlement and subsistence information. Dated coastal sites from this and the preceding time period appear to be relatively rare in the southern King and Pierce counties, perhaps due in part to destruction from development, or burial beneath historic land fill deposits.

Late Northwest Coast Culture (1,500 BP to ca 200 BP)

The period (1,500 to 200 BP), when European and American explorers arrived in the region, is characterized by continued enhancement of material culture and social complexity from that noted in the previous period (Nelson 1990; Ames and Maschner 1999; Matson and Coupland 2009). These include widespread occupation of permanent and semi-permanent coastal villages, continued intensive procurement and storage of salmon and shellfish resources, and hereditary inequality throughout the coastal cultures of the Pacific Northwest, including the Puget Sound region. Village sites have been identified in the Puget Sound lowlands, typically located adjacent to, or near, river or marine transportation routes (Larson and Lewarch 1995; Ames and Maschner 1999).

Common artifact assemblages consist of a range of hunting, fishing and food processing tools, bone and shell implements, and midden deposits. This period is dominated by settlement along the coastlines and along streams and rivers, with far greater specialization of technology than the preceding period. Trade goods become relatively abundant, indicating extensive trade networks up and down the coast as well as with inland plateau neighbors (Wessen 1985). As in the preceding period, salmon was among the primary food sources in this time period. Fish weirs and preserved netting dating to this period have been found at Wapato Creek in Tacoma (45PI47) and along the Green River (Ballard 1957; Munsell nd).

Three archaeological sites dating to the Late Northwest Coast Culture period are 3 to 7 miles south of the Federal Way Alternatives. All three were discovered during deep coring or excavation along the Puyallup River and tributaries. The *Xaxtl'abish* site (45PI974) is a midden deposit near the bank of Hylebos Creek north of the I-5 corridor and has been radiocarbon dated to ca 1,100 BP. Site deposits were found at a depth of 6 feet below the surface and were composed of shell, faunal remains, and fire-cracked rock (Shantry et al. 2010). Site 45PI930 is located east of I-5 on the south side of the Puyallup River. The site dates to ca 1,040 to 1,240 BP and is reported as a precontact village containing lithic, faunal, and botanical remains. Cultural deposits were found from 12 to 22 feet below ground surface on the west side of the Puyallup River (Sharpe et al. 2009). Site 45PI967, a shell midden on the south bank of the Puyallup River near Clear Creek, was found during backhoe testing approximately 8 feet below ground surface and dates to approximately 400 to 200 BP. The artifact assemblage consisted of burned and unburned fish bones, botanical remains, flaked and ground stone artifacts, and fire-cracked rock (Shufelt 2009).

This final precontact period of Northwest Coast Culture and its lifeways is characterized by dramatic changes to its cultures, lifeways, and communal organization with the influx of Euro-American material goods, diseases, and technologies throughout the Puget Sound and the Pacific Northwest (Boyd 1998; Suttles and Lane 1990). Ethnographically known villages, camps, and limited activity sites that were the loci of habitation, food processing, acquisition of riverine and upland plant and animal foods, along with other biotic and abiotic resources, have been documented throughout the Puget Sound region by Hilbert et al. (2001) and others. The ethnographic Northwest Coast cultures and traditional use areas around the APE are summarized in the following sections.

3.2 Ethnohistoric Period

The APE is located in the traditional territory of the contemporary Puyallup Tribe of Indians and the Muckleshoot Indian Tribe (Haeberlin and Gunther 1930; Ruby and Brown 1986; Smith 1940; Spier 1936; Hilbert et al. 2001). The Muckleshoot Tribe is a historic conglomerate of traditional Upper Puyallup, Upper Duwamish, and other “Inland” groups, such as the Sitkamish and the Smulkamish of the Upper White River reaches and the Yilalkoamish and the Skopamish of the Upper Green River reaches (Hodge 1910; Spier 1936; Smith 1940; Suttles and Lane 1990). This merging of Tribes is a direct result of the Medicine Creek Treaty (1854), the Point Elliot Treaty (1855), and the Fox Island Counsel following the 1855 to 1856 conflicts.

Precontact peoples, whose descendants are now part of the Puyallup Tribe of Indians and the Muckleshoot Indian Tribe, often had settlements located along major waterways and at the heads of bays or inlets, where abundant resources of coastal, riverine, and also inland environments supported a relatively rich, diverse, and reliable subsistence base. During the winter months, they lived in large villages of cedar plank houses, while the spring and summer months were spent at seasonal encampments often constructed of reed mats while fishing, hunting, and plant and berry collecting. Salmon was a principal resource (Ruby and Brown 1986). Early economies were also supported by inland resources, such as mountain goats, deer, and elk (Haeberlin and Gunther 1930).

The Puyallup Tribe of Indians lived in villages between the Puyallup River delta and Mount Rainier; along the Carbon and Stuck Rivers; and on the shorelines of Commencement Bay, the Gig Harbor Peninsula, and Vashon Island (Smith 1940; Hilbert et al. 2001).

The Puyallup Tribe of Indians followed a seasonal settlement pattern directly tied to resource availability. Their winter villages typically consisted of one to three houses, about 9 meters wide and up to 30.5 meters long with pitched roofs. The cedar plank walls were split from standing trees, using antler wedges and then smoothed with adzes (Smith 1940; Carpenter 1986). Cedar logs were also floated downriver to desired locations to process them on shore, generally near villages located on the banks of the creeks and rivers. Many of the villages constructed of cedar involved years of labor and were relatively permanent, often used for generations. Villages were located near river mouths or where a creek joined the main river channel (Hartwich 1972) or above the tidal flats along the margins of “two streams or at the mouth of a stream where it entered the Sound” (Smith 1940). Cedar houses were generally located on high ground away from the river or stream high-water mark. The house faced the water, with the length paralleling the river or stream (Hartwich 1972).

Winter subsistence was composed of freshwater and marine fish, shellfish, game, and preserved food collected during the other seasons. In the spring months, the Puyallup Tribe of Indians moved to temporary shelters made of reed mats and spent their time searching for fish, game, roots, berries, and bulbs. The most important fish resource was the salmon, which were caught at the mouths and along the banks of fish-bearing rivers as the salmon migrated from Puget Sound to native spawning streams. Salmon were smoked or dried for the winter and provided the bulk of food consumed and exchanged in that season (Suttles and Lane 1990).

3.3 Historic Period

Historic Euro-American exploration and settlement in the Puget Sound region begins in the AD 1600s with Spanish exploration along the western coast of North America, including the Puget Sound. In response to Spanish exploration in the region’s western waters, English explorer Captain George Vancouver and his crew investigated Puget Sound in 1792. Vancouver sent Lieutenant Peter Puget and Master Joseph Whidbey on a six-day tour of the Sound in May. The pair named various landmarks, including Whidbey Island and Puget Sound itself, as well as Mount Rainier and Hood Canal. The team then returned to Britain, where Vancouver began preparing a report of his findings. He died before it could be completed (Crowley 2003a). This was followed by the Lewis and Clark expedition in 1804 to 1806 that traveled to the mouth of the Columbia River to explore the lands purchased by the United States from France and the people who lived in them (Tate 2003).

The Hudson’s Bay Company (HBC) was an 1821 partnership between the Bay Company and the North West Company, two rival fur trading operations in Canada and the United States. HBC established its first foothold in today’s Washington state in 1825, when Chief Factor John McLoughlin moved his operation at Fort George north of the Columbia River to Fort Vancouver. From there, Captain Vancouver oversaw expansion into the Puget Sound region, where his staff traveled, trapping and trading with local Tribes until they returned south to Fort Vancouver in the fall. There, the company accepted supplies from a London supply ship each fall and loaded up the empty hold with timber bound for Hawaii. When the ship returned from Hawaii, Captain Vancouver’s staff filled the hold with pelts bound for Great Britain (Nisbet and Nisbet 2011).

Competition from American fur traders increased during the 1830s. In 1833, McLoughlin sent Archibald McDonald to Puget Sound to establish a new trading post and stockade, Fort Nisqually, at today's DuPont, Washington. In 1840, Captain Vancouver established the Puget Sound Agricultural Company at Nisqually to provide crops and livestock to an increasing number of Russian-American fur traders from Alaska (Crowley 2003b; Nisbet and Nisbet 2011). While farming at Fort Vancouver and Fort Nisqually, among other locations, HBC cultivated cattle, hogs, goats, apple trees, grape vines, potato patches, and other crop gardens. Fort Vancouver's wheat harvest alone supplied the company throughout the northwest (Rowe 2018).

HBC's Fort Nisqually was the first non-Native settlement in the Pacific Northwest, and it acted as a local hub, attracting traders, providing goods, and welcoming the first waves of Euro-American settlers. As early as 1841, Congress had passed the Distribution-Preemption Act, which recognized squatter's rights and allowed settlers to buy up to 160 acres for $1.25 an acre after 14 months' residence. In 1843, the provisional government in Oregon was offering 640-acre claims to new settlers, partly to assist the United States in establishing control of the region, which it shared with Great Britain. The United States and Great Britain settled their dispute over where to draw a boundary between the United States and Canada in 1846, settling on the 49th parallel and leaving Fort Nisqually and other HBC properties on lands owned by the U.S. government. The United States continued to encourage Euro-American settlement in the region, and waves of migrating Americans arrived. Soon, relationships between Euro-American settlers and native Tribes deteriorated and the fur trade worsened. Fort Vancouver closed in 1860 and Fort Nisqually in 1870 (Nisbet and Nisbet 2011).

While the depletion of pelts, increased settlement, and worsening Tribal relations spelled the end of HBC in the Northwest, other broad trends in development began to shape the Puget Sound region. In 1849, gold was discovered in California and settlers flowed west, either to hunt for gold or to supply those who did. Concurrently, in a succession of donation land acts, the U.S. government offered free or inexpensive land in Oregon Territory (which included today's Washington state) to settlers who moved to the region and homesteaded. To protect newly arrived settlers in the wake of an attack on Fort Nisqually, the U.S. Army established Fort Steilacoom in today's Pierce County in 1849, which provided medical care and protection but also supported a local road-building program (Denfeld 2012). In 1850, Congress passed the Donation Land Claim Act, which offered 320 acres of federal land to white male adults who established residence on the property by December 1, 1851. If married, the couple could claim an additional 320 acres (Riddle 2010).

In 1853, Washington Territory was carved from the Oregon Territory. While the Donation Land Claim Act was still in effect, the rules changed in 1854, and settlers in the Northwest had to purchase land for $1.25 an acre, which remained the law until the Homestead Act was passed in 1862. The first land patents in Washington Territory were granted in Thurston and Clark counties in 1857 (Riddle 2010).

While settlement increased, the new arrivals brought with them agricultural and ranching practices that introduced new species, suppressed native species, introduced new weeds and new crop diseases, and led to the suppression of traditional life ways, including the late-summer controlled burns that Native Tribes used to prepare the land for new crops of camas and berries (Rowe 2018). While non-Native settlement grew, and tensions rose, Territorial Governor Isaac Stevenson negotiated a series of treaties with Native inhabitants, confining them to reservations away from their native homelands and further increasing tensions that eventually led to war (Rowe 2018).

The Medicine Creek Treaty (1854) and the Point Elliott Treaty (1855) were both attempts by the U.S. government to buy territory and fishing rights from the Tribes in exchange for permanent reservation lands (Ruby and Brown 1986). In late December 1854, Stevens, General George Gibbs, and local officials met with 600 Native American Tribal members, including members of the Nisqually, Puyallup, and Squaxin Tribes near She-na-nam, or Medicine Creek (now known as McAllister Creek), approximately 20 miles southwest of Tacoma, in Nisqually (Gibbs 1877). The Medicine Creek Treaty (1854) removed Native Americans from about 2.2 million acres of their traditional lands and granted three reservations for them to share. The treaty provided rights to fish, hunt, gather roots and berries, and pasture horses; provided rules of conduct; and appropriated $32,500 to be paid to the Tribes over a 20-year period. The treaties forced Native Americans to relocate to one of several reservations designated in the treaties (Ruby and Brown 1986). Of the three initial reservations defined in the Medicine Creek and Point Elliott treaties, the largest was the Puyallup, with 1,280 acres. The Puyallup Reservation was home to people who identified with the Nisqually, Cowlitz, Muckleshoot, and other local area Tribal groups (Kirk and Alexander 1990; Smith 1940; Suttles and Lane 1990).

Between 1855 and 1858, what was then called the “Indian Wars” broke out and unsettled Native American and Euro-American relations across Washington Territory, leading many homesteaders to retreat to secure locations like Fort Steilacoom and briefly limiting settlement in some locations, including Pierce County (Rowe 2018). However, with the end of hostilities, settlement soon increased again. With the success of local agriculture, the availability of timber, and access to the rivers of Puget Sound, settlers spread across the region. New advancements in transportation, including the coming of the nation’s second transcontinental railroad, further spurred development. After the Puget Sound Indian War of 1855–1858, the Nisqually, Puyallup, and White and Green River Tribes met with an American delegation led by Governor Stevens on Fox Island. Two of the resulting agreements were the enlargement of the Puyallup Reservation to 18,062 acres by executive order (Ruby and Brown 1992) and recognition of the need for a reservation in a more appropriate location for those groups culturally linked to inland areas. The reservation was to be placed between the White and Green Rivers at Muckleshoot, where a U.S. Army fort was located on the prairie of the same name.

The passage of the 1862 Homestead Act granted 160 acres to individual U.S. citizens in an effort to further encourage non-Native settlement. Eventually, commercial and residential development expanded, and citizens began to request that restrictions on reservation lands be removed to accommodate urban and industrial growth. Many Tribal landowners would eventually lose their properties through sale, auction, or approval by the government for automatic inclusion in land grants. In 1864, a land grant was provided for the construction of the Northern Pacific Railroad (NP), and a line was planned that would extend from the Great Lakes to Tacoma.

In 1873, as Northern Pacific Railroad executives toured Washington in search of a terminus for their new railroad line, cities up and down Puget Sound competed for the honor, offering perks and financial advantages, knowing that with the railroad would come industry, a growing population, and wealth. In July 1873, Northern Pacific executives announced that Tacoma’s Commencement Bay would be the railroad’s new terminus. It was undeveloped and closer to the rail line’s route along the Columbia River than Seattle. The decision set off a bitter rivalry between the two cities and kicked off decades of rail expansion in the area, thrilling entrepreneurs like Tacoma’s first promoter, Matthew McCarver, who had located the city on Commencement Bay hoping to attract the railroad to its deep-water port (MacIntosh and Wilma 1999).

3.4 Additional Alternative-Specific, Historic Context

This section of the report focuses on a more detailed context for historic developments within and near the APE for OMF South that will be constructed in King County. Because there are differences in the developmental histories within the Area of Potential, this section discusses the historical context for the Preferred Alternative, the South 344th Street Alternative, and the Midway Landfill Alternative.

3.4.1 Preferred Alternative

The Preferred Alternative would be constructed in southern King County in the city of Federal Way.

While urban centers like Tacoma and Seattle were quick to grow, today’s Federal Way was slow to develop. In the 1850s, under supervision of the U.S. Army, surveyors began to prepare a road between Fort Steilacoom in Pierce County and Fort Bellingham in King County (Meador 2014).

While the military road was designed to ease the movement of troops, the transportation corridor allowed for increased exploration in the area. By 1880, a school was established at Star Lake, approximately 6 miles north of the APE, near where the town’s first post office would be established in 1891. In 1890, Arthur Steele settled at what is now known as Steel Lake, approximately 1 mile north of the APE, which would become the site of one of the area’s first sawmills in 1890. While settlement picked up slowly, timber was plentiful. Homesteaders constructed log cabins, logged the surrounding area, and constructed skid roads to move their logs to the Sound for distribution and corduroy roads for overland travel (Historical Society of Federal Way 2015).

Not until the turn of the century did Federal Way attract much commercial development. In 1904, Charles Betts opened the first store in this rural community, which was generally limited to small farmsteads. While the area remained sparsely developed, as early as 1910, the Pacific Highway Association was meeting in Seattle to discuss how to construct a highway between Mexico and Canada. In 1915, the U.S. Army Corps of Engineers began constructing a dirt road while headquartered at Camp Lewis. In 1925, the U.S. government designated the original dirt road an interstate highway, US 99 (also called the Pacific Highway), thereby freeing up federal funds for paving the section between Tacoma and Seattle, which ran alongside the Military Road in many places and was sometimes known as the “federal way” (Givens 2017). Completed in 1930, the highway connected today’s Federal Way to the rest of the west by way of a smooth, generally straight, concrete thoroughfare, but the Great Depression, which descended in the 1930s, stalled roadside development in the area. The Depression was followed by World War II, which centered resources on the war effort, further curtailing growth in small rural hubs and concentrating new growth in Seattle and Tacoma, where ship and airplane builders were most active.

With the end of World War II, development again picked up in the area, and those traveling US 99 soon found restaurants, diners, and hotels in today’s Federal Way, along with roadside attractions and shopping centers, including the Federal Way Shopping Mall at the southwest corner of US 99 and S 312th Street, just northwest of the APE (Givens 2017; Historical Society of Federal Way 2015; Stein 2003).

Like many small communities in Washington, Federal Way saw expansion in the late twentieth century due to the construction of I-5 just 1 mile east of US 99. Soon, construction teams were building new housing developments, some of which were built to accommodate employees of a nearby Boeing plant and their families. In 1968, Weyerhaeuser began to build its corporate headquarters in Federal Way. It opened officially in 1971. In 1979, a 798-car, 5.62-acre park-and-ride lot opened off I-5 at S 320th Street. At the time, it was the largest such lot in Washington. Other large developments, including the Wild Waves Pool at Enchanted Village, which remains visible east of I-5 today; St. Francis Community Hospital and a Federal Way Costco store were constructed in the 1980s (Historical Society of Federal Way 2015; Stein 2003).

Federal Way attempted to incorporate first in 1971, then again in 1981 and 1985, but failed. In 1989, voters finally approved incorporation, and the city of Federal Way was officially incorporated in 1990 (Stein 2003).

3.4.2 South 344th Street Alternative

The South 344th Street Alternative would be constructed in southern King County in the city of Federal Way.

While urban centers like Tacoma and Seattle were quick to grow, today’s Federal Way was slow to develop. In the 1850s, under supervision of the U.S. Army, surveyors began to prepare a road between Fort Steilacoom in Pierce County and Fort Bellingham in King County (Meador 2014).

While the military road was designed to ease the movement of troops, the transportation corridor allowed for increased exploration in the area. By 1880, a school was established at Star Lake, approximately 6 miles north of the APE, near where the town’s first post office would be established in 1891. In 1890, Arthur Steele settled at what is now known as Steel Lake, approximately 1 mile north of the APE, which would become the site of one of the area’s first sawmills in 1890. While settlement picked up slowly, timber was plentiful. Homesteaders constructed log cabins, logged the surrounding area, and constructed skid roads to move their logs to the Sound for distribution and corduroy roads for overland travel (Historical Society of Federal Way 2015).

Not until the turn of the century did Federal Way attract much commercial development. In 1904, Charles Betts opened the first store in this rural community, which was generally limited to small farmsteads. While the area remained sparsely developed, as early as 1910, the Pacific Highway Association was meeting in Seattle to discuss how to construct a highway between Mexico and Canada. In 1915, the U.S. Army Corps of Engineers began constructing a dirt road while headquartered at Camp Lewis. In 1925, the U.S. government designated the original dirt road an interstate highway, US 99 (also called the Pacific Highway), thereby freeing up federal funds for paving the section between Tacoma and Seattle, which ran alongside the Military Road in many places and was sometimes known as the “federal way” (Givens 2017). Completed in 1930, the highway connected today’s Federal Way to the rest of the west by way of a smooth, generally straight, concrete thoroughfare, but the Great Depression, which descended in the 1930s, stalled roadside development in the area. The Depression was followed by World War II, which centered resources on the war effort, further curtailing growth in small rural hubs and concentrating new growth in Seattle and Tacoma, where ship and airplane builders were most active.

With the end of World War II, development again picked up in the area, and those traveling US 99 soon found restaurants, diners, and hotels in today’s Federal Way, along with roadside attractions and shopping centers, including the Federal Way Shopping Mall at the southwest corner of US 99 and S 312th Street, just northwest of the APE (Givens 2017; Historical Society of Federal Way 2015; Stein 2003).

Like many small communities in Washington, Federal Way saw expansion in the late twentieth century due to the construction of I-5 just 1 mile east of US 99. Soon, construction teams were building new housing developments, some of which were built to accommodate employees of a nearby Boeing plant and their families. In 1968, Weyerhaeuser began to build its corporate headquarters in Federal Way. It opened officially in 1971. In 1979, a 798-car, 5.62-acre park-and-ride lot opened off I-5 at S 320th Street. At the time, it was the largest such lot in Washington. Other large developments, including the Wild Waves Pool at Enchanted Village, which remains visible east of I-5 today; St. Francis Community Hospital; and a Federal Way Costco store were constructed in the 1980s (Historical Society of Federal Way 2015; Stein 2003).

Federal Way attempted to incorporate first in 1971, then again in 1981 and 1985, but failed. In 1989, voters finally approved incorporation, and the city of Federal Way was officially incorporated in 1990 (Stein 2003).

3.4.3 Midway Landfill Alternative

The Midway Landfill Alternative would be constructed in Midway, a small community in the city of Kent, located in southern King County.

As with surrounding King and Pierce counties, the community of Kent began as an agricultural community established on the cleared lands of Washington’s river valleys at the end of hostilities between Euro-American settlers and Native American Tribes (Stein 2001).

Early settlers cut timber and founded farms, providing crops including hops to an expanding market. Wildly successful for a decade, the hop market collapsed in 1891 after aphids decimated local crops, which never recovered. While hops failed, the valley’s agricultural tradition was strong, and dairying, farming, egg production, and vegetable farming grew in the region while the city of Kent established the schools, churches, and commercial developments needed to support the growing city center. Much of what the valley produced was sent to market in urban centers like Seattle and Tacoma. By 1920, the region’s successful Japanese farmers, generally first-generation Issei, were supplying half the fresh milk and more than 70 percent of the vegetables and fruits consumed in Seattle. The strength of the agricultural community helped sustain Kent through the Great Depression. However, with the beginning of World War II, the valley was forever changed. Japanese families, only some of whom were allowed to sell or otherwise negotiate the care of their lands, were interned under Executive Order 9066. The government took 1,600 acres of land and distributed it to other farmers. With the war’s end, few Japanese farmers returned to the area (Stein 2001).

It was also during the 1930s and 1940s that the area known as Midway developed. This development was prompted by the expanding transportation network between Tacoma and Seattle, particularly the White River bypass (now SR 99) in 1928 (Seattle Times 1928). Located along SR 99 and named for its location midway between Tacoma and Seattle, the area provided motels and diners for highway drivers. Beginning in 1931, however, Midway became known as an entertainment hotspot for the roadside spectacle known as the Highline Spanish Castle, a live music venue that drew people from around Puget Sound to dance to the big bands (Blecha 2002; City of Kent 2001; Seattle Times 1964).

In 1945, the Meade Sand and Gravel Company based out of Auburn, Washington, began using the alternative site as a sand and gravel mine. Originally, the mine was adjacent to a natural drainage basin that was often used as a settling pond. The drainage, located on the northeast section of the present landfill, was drained near the end of the mine’s operations; as a result, most of the landfill floor is covered in a layer of fine silts and clays. The city of Seattle leased the site in 1966 for use as a landfill. The site was primarily used as a landfill for demolition debris; however, some hazardous and industrial wastes were buried there. The placement of hazardous waste on-site was halted in 1980, and the landfill was closed in 1983 (EPA 2000).

In 1984, the landfill was nominated for inclusion on the federal National Priorities List (NPL) and then listed in 1986. This designation is commonly referred to as a “Superfund” designation. In 1990, the city of Seattle and the Washington State Department of Ecology (Ecology) entered into a Consent Decree for environmental remediation of the site. This decree required that the landfill surface be filled, graded, and capped; a stormwater detention pond be constructed with associated dewatering and discharge systems; the Linda Heights Park stormwater system be diverted; and a landfill gas control system installed (EPA 2000).

Regional growth in the area was partly due to the control of the valley’s rivers, which traditionally led to intense flooding. In 1965, the U.S. Army Corps of Engineers completed a dam for the Green River, thereby limiting flooding in Kent. Boeing was one of many industrial developers to come to Kent. I-5 was completed through Kent in 1966, and decades of growth followed. Warehouse and manufacturing plants sprung up, to be followed by a wave of high-tech development (Stein 2001).

4 ARCHAEOLOGICAL EXPECTATIONS

4.1 Alternative-Specific Cultural Sensitivity Summaries

The following section provides summaries of data presented above, as well as expectations for discovery of precontact and historic archaeological sites. The discussions below are specific to each of the alternatives: Preferred, South 344th Street, and Midway Landfill. In general, based on information presented above, the Midway Landfill Alternative has a lower likelihood of including archaeological resources than the Preferred and South 344th Street alternatives.

Within each of the APE, potential culture-bearing sediments are anticipated to be located near the surface due to the geologic setting of the OMF South project area (see Section 3).

4.1.1 Preferred Alternative

Based on DAHP’s predictive model data and assessment of the background data, the APE for this alternative has a very low to low probability for precontact archaeological materials. The location’s use as timberland and farmland as well as commercial, residential, and light industrial development has very likely destroyed any precontact archaeological materials that may have been present. The potential for precontact archaeological materials in the immediate vicinity of the Preferred Alternative is likely low based on this history of development and the glacial landform on which the APE is primarily situated. Historic land use has modified the landscape and near-surface archaeological potential. The construction of SR 99 and I-5 have also dramatically affected the landforms in the APE.

US 99 is a historic transportation corridor, completed in 1928, which provided ease of access to the area. Extensive development did not occur until the 1950s with the expansion of commercial, industrial, and residential areas. Historic archaeological potential within the APE for this alternative is moderate.

Given the scale of ground disturbances with original construction and subsequent expansions of US 99 and I-5, the Christian Faith Center, and other large landscape alternation projects, it is probable that, if precontact and historic cultural resources existed, they are disturbed and/or intermixed with historic/recent fill deposits.

4.1.2 South 344th Street Alternative

Based on DAHP’s predictive model data and assessment of the background data, the APE for this alternative has a very low to low probability for precontact archaeological materials. The location’s use as timberland and farmland as well as commercial, residential, and light industrial development has very likely destroyed any precontact archaeological materials that may have been present. The potential for precontact archaeological materials in the immediate vicinity of the South 344th Street Alternative is likely low based on this history of development and the glacial landform on which the APE is primarily situated. Historic land use has modified the landscape and near-surface archaeological potential. The construction of US 99 and I-5 have also dramatically affected the landforms in the APE.

US 99 is a historic transportation corridor, completed in 1928, which provided ease of access to the area. Extensive development did not occur until the 1950s with the expansion of commercial, industrial, and residential areas. Historic archaeological potential within the APE for this alternative is moderate.

Given the scale of ground disturbances with original construction and subsequent expansions of US 99 and I-5, and other large landscape alternation projects, it is probable that, if precontact and historic cultural resources existed, they are disturbed and/or intermixed with historic/recent fill deposits.

4.1.3 Midway Landfill Alternative

Based on DAHP's predictive model data and assessment of the background data, the APE for this alternative has a very low probability for precontact archaeological materials. The location's use as first a gravel mine and then a landfill has very likely destroyed any precontact archaeological materials that may have been present. The potential for precontact archaeological materials in the immediate vicinity of the Midway Landfill is likely low based on this history of development and the glacial landform the APE is primarily situated on. Historic land use, including agriculture and urban development, has modified the landscape and near-surface archaeological potential. The construction of US 99 and I-5 have also dramatically affected the landforms in the APE.

US 99 is a historic transportation corridor, completed in 1928, which provided ease of access to the area. Extensive development did not occur until the 1950s with the expansion of commercial, industrial, and residential areas. Historic archaeological potential within the APE for this alternative is relatively low, in large part because the landfill dominates this APE.

Given the scale of ground disturbances with initial construction of US 99 and I-5 and subsequent expansions, the historic limits of the Meade Sand and Gravel Mine, and modern filling, capping and remediation of the Midway Landfill, it is probable that, if precontact and historic cultural resources existed, they are disturbed and/or intermixed with historic/recent fill deposits.

4.2 Expectations

From an archaeological perspective, precontact and ethnographic site types that could be encountered within the APE include short-term field camps and seasonally utilized resource-procurement and processing loci. Resource procurement and processing loci represent a wide variety of activities that vary according to resource types present and environmental setting. Site functions likely varied from short-term occupation sites to task-specific processing or resource-extraction sites. Activities at these kinds of sites would include shellfish or salmonid procurement, game hunting sites, plant gathering areas, felling trees for planks, and localities where flaked and ground stone material sources exist. In addition, other site types or features would have been present in the precontact and early contact period cultural landscapes associated with occupation of upland settings. These include trails linking villages or accessing resource procurement loci, rock art, culturally modified trees, and burials among others; however, it is unlikely that the latter set of site types are extant because of modern and historic development and logging.

From the information developed in Sections 2 and 3 of this technical report, there is evidence of known historic archaeological sites that range from assumed remains of an array of commercial, governmental, and residential structures, historic trash deposits and dumps, and road beds that have been abandoned and covered by later developments, and a large array of associated features. These may include privies, storage dugouts, outbuildings, cemeteries, agricultural buildings, fields, and orchards, among others.

The risk of encountering near-surface ethnohistoric and historic archaeological materials in the APE is reduced by historic land alterations related to industrialization, development, and urban growth at all three alternative locations – in particular, the Midway Landfill Alternative. Within the Preferred Alternative and South 344th Street APE, the historic landscape alterations include historic logging and agriculture, extensive land reclamation, and development intensifying in the mid-20th century.

5 METHODS

5.1 Archaeological Investigations

All archaeological survey coverage was restricted to those parcels where a right of entry had been procured by Sound Transit and municipal and state rights-of-way (Figures G4.6-1, G4.6-2, G4.6-11, G4.6-12, and G4.6-16). Within these constraints the archaeological field investigations began with a pre-field identification of locations within the APE, as defined by the conceptual design for the project, that would be accessible for investigation. This review resulted in the identification of locations for subsequent subsurface investigation. A pedestrian survey within the anticipated area of ground disturbance was undertaken using adjacent transects spaced at 10-meter intervals (maximum). All areas not subject to pedestrian reconnaissance due to artificial surface coverage (pavement or imported fill) were identified and documented.

Shovel probes and hand augering were used to investigate areas where ground disturbance is anticipated. Shovel probes were spaced between 20 meters apart in areas of high archaeological probability and 30 meters apart in areas where the probability of encountering archaeological resources is generally low. Areas of apparent previous disturbance were identified and classified as low sensitivity areas; however, the depths of proposed impacts were considered when determining the appropriate survey method for a given landform. Prior to subsurface survey, all proposed excavation locations were cleared by utility locates.

Each shovel probe was a minimum of 30 centimeters in diameter and was excavated to approximately 20 centimeters into intact glacially deposited sediment up to 1 meter below surface where possible. In some locations, where deeper fill was anticipated or encountered, shovel probes were replaced with auger cores, which can more efficiently be used to investigate soils underlying fill. When glacially derived parent material (e.g., intact glacial till or outwash) was identified, the excavation was terminated.

All sediments/soils excavated during archaeological survey were screened through 0.25-inch wire mesh hardware cloth. Global positioning system coordinates were collected for each shovel probe and auger core and incorporated into a map layer (Figures G4.6-3, G4.6-4, G4.6-13, G4.6-14, and G4.6-17). Soil types and colors were documented using the Munsell Soil Color Chart for each shovel probe and auger core. When sediment change was observed during excavations, the depth of transition and information on whether the transition is abrupt or gradual was documented. A brief statement of stratigraphic interpretation was compiled for all geographical areas where general stratigraphic trends were identified. Each shove probe and auger core were photographed. The shovel probe log is provided in Attachment G4-3.

Archaeological survey occurred over several field sessions. The first took place in February 2020 and included a systematic 10-meter transect interval pedestrian survey of the Preferred, South 344th Street, and Midway Landfill alternatives to document existing conditions within the APE. This survey excluded the mainline segment areas of the Preferred and South 344th Street APE where they overlapped with the APE for the Tacoma Dome Link Extension (TDLE). Subsurface shovel probe surveys were limited to accessible undeveloped areas of the Preferred and South 344th Street alternatives. Field staff documented survey areas, surface conditions, and any archaeological resources that were present (Figures G4.6-3, G4.6-4, G4.6-13, G4.6-14, and G4.6-17). The second field session occurred in June 2020 and consisted of assessments of the previously identified resources (see Sections 6.1.1.4 and 6.1.1.5). The third field session for the mainline segment within the OMF South and TDLE overlap area was completed in January 2021.

5.1.1 Areas Contaminated by Biohazards

In addition to standard safety protocols and pre-fieldwork discussion of the hazards and safety methods briefing, the potential hazards presented to field crew in settings where hazardous waste was identified were mitigated by wearing eye protection, face masks, leather gloves, and using sanitizers. Site-specific fieldwork methods to mitigate the hazardous conditions, particularly from human excrement and drug-related paraphernalia, were devised. The methods employed included 1) scraping off the loose surface layer containing the majority of the hazardous material prior to excavation; 2) excavating, but not screening, the first 10-centimeter (6-inch) layer of sediment; 3) screening excavated sediments to minimize shaking with careful removal of non-modern historic artifacts, and; 4) avoiding contact with items perceived as potentially hazardous.

5.1.2 COVID-19 Protocols

Following the outbreak of COVID-19, the safety protocols observed during field investigations were amended to be consistent with the Governor's Office "Stay Home, Stay Healthy" proclamation; Governor Inslee's March 25, 2020, memorandum; Governor Inslee's Construction Working Group Recommendations (April 23, 2020); and the Center for Disease Control and Occupational Safety & Health Act of 1970 guidance. These amendments were detailed in Governor Inslee's recommendations in 30 detailed points, which included specialized safety training, contact tracing documentation, social distancing, amendments to standard personal protective equipment (PPE), standards of sanitation and cleanliness, and an overview of employee health and COVID-19 symptoms.

5.1.3 Site-Specific Investigation Methods

Two historic archaeological sites, 45KI1542 and 45KI1543, were discovered during surveys of the Preferred Alternative and South 344th Street APE. The first, 45KI1542, is in the Preferred Alternative APE and consists of the remnants of a concrete foundation and stub walls of a historic building dating to the 1930s. The second, 45KI1543, is within both the Preferred and South 344th Street APE. This site consists of a sparse scatter of modern and temporally non-diagnostic construction debris. The results of the archaeological investigations at these sites are further described in Section 6.1.

Around 45KI1542, a pedestrian survey was conducted, maintaining a constant 1-meter interval spacing across the site to identify the full extent of the foundation and any associated historical debris on the surface. Where access was possible, shovel probes were excavated at distances of 5 and 10 meters around the perimeter of the foundation (see Figure G4.6-27). The location of shovel probes was restricted due to existing ground conditions. All shovel probes were excavated using the methodology described above.

Around 45KI1543, a pedestrian survey was conducted, maintaining a constant 2-meter-interval safety spacing across the entire landform to identify any historic debris on the surface and the presence of utilities. Excavations began in the northeast corner of the landform and progressed at 3-meter intervals in cardinal directions from the initial positive shovel probes until two negative probes had been excavated, or the landform conditions restricted further testing. All shovel probes were excavated using the methodology described above.

ATCRC and HRA evaluated all surveyed resources for eligibility to the NRHP, WHR, and KCRHP (see detailed discussion of these registers and criteria below in Section 5.3). Although criteria for listing vary between national, state, and local jurisdictions, all listing criteria are based on those established for the NRHP with local nuances for WHR and local registers. Therefore, ATCRC and HRA completed evaluations under all NRHP criteria and drew its conclusions regarding state and local listing from these evaluations. DAHP does not provide determinations of eligibility for local jurisdictions (Section 5.3).

5.2 Built-Environment Survey and Inventory

From August to November 2019, HRA conducted archival research on the history of the APE. Archival research consisted of background research using King County Assessor’s records, historic maps and aerials, and previously prepared records located in DAHP’s WISAARD database. To complete historic contexts on development within the APE, HRA reviewed local histories, historic maps, newspaper archives, resources in HRA’s own library, and additional online sources, as needed.

In December 2019 and January and May 2020, HRA conducted a survey and inventory of all resources within the APE that would be 40 years old or older at the beginning of project construction, estimated to be the year 2025. By 2025, historic-period, built-environment resources built in 1985 or earlier will be 40 years old, meeting age criteria for listing as King County Landmarks but not the WHR or NRHP. Historic-period, built-environment resources that are 50 years old or older by 2025 will have reached the age at which they can qualify for listing in the WHR and NRHP. Survey and inventory were conducted to meet DAHP’s updated Standards for Cultural Resources Reporting (DAHP 2020a).

The only historic-period, built-environment resources built in 1985 or earlier that were exempted from survey were BPA transmission system elements. In 2020, as the lead federal agency for relocating the BPA transmission lines under NEPA, BPA conducted its own consultation with SHPO under Section 106 regarding the relocation of towers along the Tacoma-Covington No. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines in association with OMF South. BPA determined that the transmission lines were eligible for listing in the NRHP but that proposed tower relocation does not constitute an adverse effect under Section 106. In a letter dated August 19, 2021, SHPO concurred with the finding (see Attachment G4-6). Subsequently, in a letter dated October 27, 2023, FTA determined that the tower relocation does not constitute an adverse effect under Section 106 and SHPO concurred in a letter dated October 31, 2023. Therefore, no additional analysis of effects on the transmission lines was warranted. Additional exemptions included all other built-environment resources already documented in DAHP’s WISAARD database and having an HPI that had received a formal determination of eligibility within the last ten years. Documentation for those resources was considered up to date, and no further documentation was required, as per DAHP’s guidelines (DAHP 2020a).

King County Assessor’s records provided dates of construction for most resources within the APE. In cases where no dates of construction were available but a review of maps or aerial photographs suggested that historic-period, built-environment resources may be present, dates of construction could not be determined by desktop research. In those instances, HRA conducted a field visit to the locations, and when historic-period, built-environment resources were present, they were added to the survey and documented and evaluated.

5.2.1 Field Survey

Field documentation included photographing all visible exterior elevations of each historic-period resource and collecting field notes on an electronic tablet, noting character-defining features, characteristics of style, materials, and evidence of alteration, as per the Washington State Standards for Cultural Resources Reporting (DAHP 2020a). All resources were surveyed from the public right-of-way, unless otherwise noted. Results from HRA's study were recorded in HPIs in WISAARD's database for all resources old enough to qualify for listing in the NRHP (Attachment G4-5). No HPIs were completed for those resources not old enough to qualify for the NRHP or those for which DAHP or a lead agency has already made a determination of eligibility.

The results of survey and inventory, paired with additional archival research, resulted in Sound Transit's initial recommendations regarding each surveyed resource's eligibility for listing in the NRHP. FTA, in consultation with SHPO, determined the NRHP eligibility of surveyed resources.

To be eligible for listing in the NRHP, a resource must meet one of four criteria for significance (NRHP Criteria A, B, C, or D) and possess sufficient integrity to express its significance (NPS 1995). See Section 1.4, Regulatory Setting.

6 RESULTS

6.1 Archaeological Survey and Results

This section details the archaeological survey sessions and the results for the APE.

6.1.1 Field Survey

The first archaeological survey session occurred over five days across the APE. Pedestrian survey with photographic recordation of surface condition, utilities, and areas of interest occurred on February 13, 14, and 19, 2020. Sub-surface survey occurred on February 24 and 25, 2020, using the methods described above (Section 5.1). During this field session, ATCRC identified two previously unrecorded historic-period archaeological sites. Additional investigations were performed at each site during the second archaeological survey session.

From June 10–12, 2020, a second archaeological survey session occurred at the historic-period archaeological sites identified within the APE in the Preferred and South 344th Street Alternatives areas. The goals of the additional targeted efforts at the site of the historic-period foundation (45KI1542) were to identify subsurface features related to the 1930s- to 1950s-era historic use of the structure, and assess the extent, content, and depositional context of any historic-period deposits. The goals for the artifact scatter (45KI1543) were to excavate radials at cardinal directions around previously excavated shovel probes that contained artifacts, thereby determining extent, content, and depositional context of the scatter subsurface cultural resources.

The survey of the OMF South and TDLE overlap area was conducted from January 4 to 21, 2021. The survey of the overlap area was conducted concurrently with other TDLE survey areas. During the survey, HRA and ATCRC identified one historic-period archaeological isolate (45KI1583). The isolate is an amber glass beer bottle dating to 1966 (Figure G4.6-45).

Each survey consisted of additional pedestrian transects with photographic documentation of surface conditions, utilities, etc., and a subsurface survey of each location. The survey methods for these locations vary from the standard methodology described in Section 5.1.

6.1.1.1 Preferred Alternative

Within the Preferred Alternative APE, rights of entry were acquired that centered around two large properties, the Belmor Park Golf & Country Club (Belmor) and the Christian Faith Center, and all municipal and state rights-of-way, including the WSDOT right-of-way along I-5. Those parcels within the defined APE that were not evaluated as potential subsurface survey areas because rights of entry had not been obtained are identified in Figures G4.6-1 and G4.6-2.

The survey proceeded with a pedestrian assessment and photo documentation of all accessible areas within the APE. For those parcels where a right of entry had not been obtained, the survey was conducted from the nearest public right-of-way. The survey also included a limited pedestrian survey of the wetlands located within parcel OMF 152 (Figures G4.6-4 and G4.6-5). Subsurface investigations within the APE began in OMF 151 (Figures G4.6-2 and G4.6-4). Much of the parcel has been developed with extensive paved parking lots surrounding the Christian Faith Center. These paved areas are partially surrounded by ornamental green space that were sampled where utilities were not present (Figure G4.6-6). The excavations along the northwest corner of OMF 151, adjacent to OMF 152, were along a slope composed of multiple soil types (Figure G4.6-4). These soil strata are modern fill events mixed with expected soil horizons per Natural Resource Conservation Service (NRCS) data (stratified muck) resulting from flood events within the wetlands (OMF 152) overlaying glacial till. Elsewhere on the property, fill of varying thickness was found immediately overlaying noncultural glacial deposits (Figures G4.6-4 and G4.6-7).

The far southern portion of parcel OMF 151, near OMF 180, is a large, mounded platform that has been substantially modified during and after the 1970s. The subsurface investigations on this landform identified soil containing modern bricks, glass fragments, and tile mixed with charcoal at depths ranging from 15 to 30 centimeters below surface in SPs 47A, 47B, and 51 (Figure G4.6-4 and Attachments G4-3 and G4-4). These excavations and additional adjacent excavations indicate that the platform was apparently created through multiple episodes of deposition of modern fill over glacial till deposits that were identified at depths between 35 to 45 centimeters below surface. These artifact-bearing sediments represent an archaeological deposit defined as site 45KI1543. Following discussions with Sound Transit, further investigations at site 45KI1543 were determined necessary to assess the content, subsurface extent, and context of this historic deposit (see Section 6.1.1.6 and 6.1.2.2 below; Attachment G4-4).

FIGURE G4.6-4
Archaeological Survey Results
Preferred Alternative

OMF South

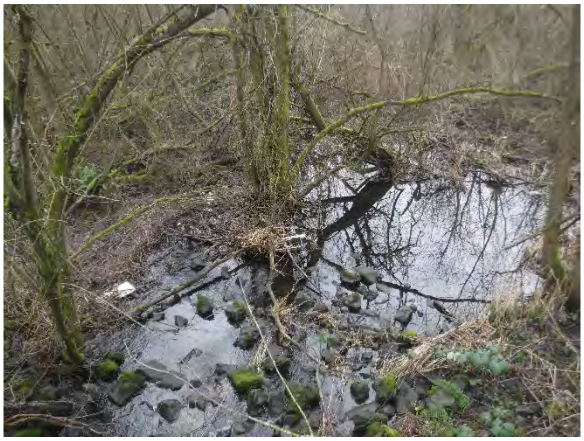

Figure G4.6-5 View of the wetlands catch basin from S 336th Street, OMF 152, view south

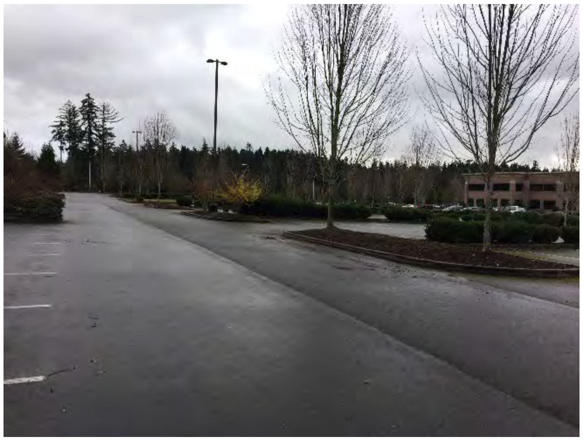

Figure G4.6-6 Paved areas partially surrounded by ornamental green space, OMF 151, view west

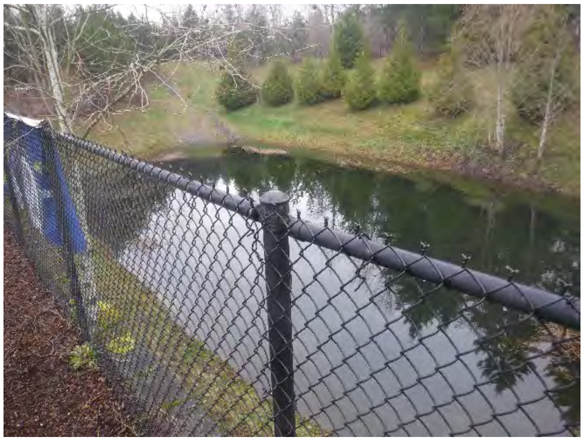

Figure G4.6-7 Drainage pond with restricted access, OMF 151, view east

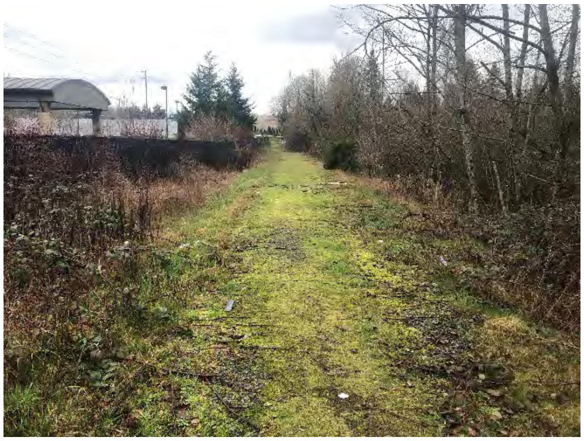

Figure G4.6-8 View of the levee along the western boundary of OMF 152, view north

Sub-surface investigations within parcel OMF 152 were predominantly restricted to the western edge and the southeast corner (Figure G4.6-4). The property is a wetland catch basin protected by Federal Way (Figure G4.6-5). The western boundary of the parcel is an overgrown raised linear earthen platform with floodgates and pumps that run north and south along the edge of the parcel (Figure G4.6-8). The wetland catch basin is composed of thick trees with standing water throughout.

Most shovel probes planned for excavation within parcel OMF 152 were canceled due to standing water and the presence of medical waste (e.g. used and uncovered hypodermic needles). The excavation of SP12 revealed soils consistent with NRCS data (stratified diatomaceous earth to muck) to a depth of 1 meter, and the excavations of SP17 and SP16 had loose, brown sandy loam fill over glacial till at a depth of 60 centimeters (Figure G4.6-4 and Attachment G4-2).

In parcel OMF 156, six shovel probes were excavated identifying variably compact brown sandy loam fill overlaying glacial till (Figure G4.6-4 and Attachment G4-2). The concrete footings of a demolished structure (45KI1542) were observed at the edge of the wetlands at the northeastern extent of the parcel adjacent to OMF 152. The footings were found to surround a concrete pad in two levels. The entire superstructure has been demolished. The entire area had been used by transient populations for camping and remains covered in garbage, including medical waste. Following discussions with Sound Transit, further investigations at this site were determined necessary to assess the potential for subsurface features related to the 1930s- to 1950s-era historic use and or occupation of the structure and to assess the extent, content, and depositional context of any historic-period deposits, if any were identified (see Section 6.1.1.4 and 6.1.2.1 below, and Attachment G4-2).

Excavations on the boundary of parcels OMF 157 and OMF 151 identified a thin topsoil overlaying glacial till (Figure G4.6-4).

ATCRC attempted to complete subsurface testing of OMF 167 (Figure G4.6-4). However, despite an approved right of entry, the property had been gated, locked, and no residents were present for surveyors to request admittance pursuant to the approved right of entry.

Parcel OMF 179 (Figure G4.6-4) is heavily overgrown with blackberry vines and other tall shrubbery to a height of 8 to 12 feet interspersed with trees (Figure G4.6-9). ATCRC used a machete to access the property and was able to excavate three shovel probes on a diagonal transect across the property (Figure G4.6-4). Car parts and other modern debris (Figure G4.6-10) have been extensively deposited on the property and shovel probes identified modern fill material to a depth of 70 centimeters before refusal due to concrete debris. Further investigations on the property were stymied due to the extensive overgrowth and modern debris.

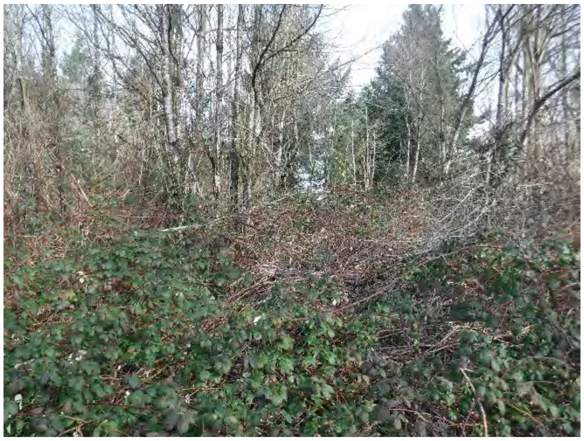

Figure G4.6-9 Surface conditions with extensive vegetation within OMF 179, view north

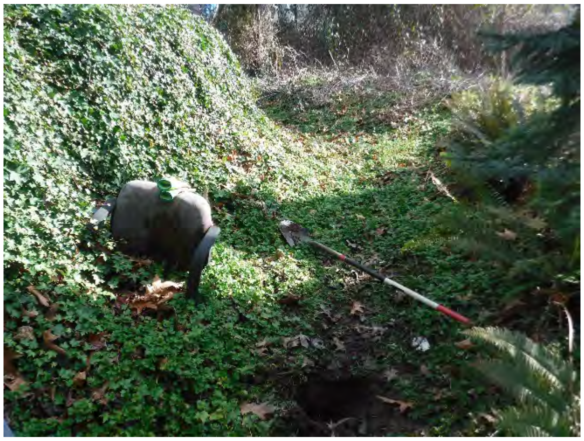

Figure G4.6-10 Easily accessible portion of OMF 179 with a surface scatter of modern debris, view northeast

6.1.1.2 South 344th Street Alternative

Within the South 344th Street Alternative, those rights of entry that were acquired centered around Belmor and the Christian Faith Center and all municipal and state rights-of-way, including the WSDOT right-of-way along I-5. Most of the properties within this APE are heavily developed with limited surface access areas, and few rights of entry were acquired for the OMF site itself (Figure G4.6-11 and G4.6-12).

The survey proceeded with a pedestrian assessment and photo documentation of all accessible areas within the APE. For those parcels where a right of entry had not been obtained, the survey was conducted from the nearest public right-of-way (Figures G4.6-13 and G4.6-14).

The area within parcel OMF 150 that does not overlap with the TDLE APE consists of a large, landscaped hill. Subsurface testing of the hill revealed that it is composed entirely of modern fill overlaying glacial till, which corresponds to aerial imagery from 2005 (Google Earth 2020).

Subsurface investigations within the APE began in parcel OMF 151 (Figures G4.6-12 and G4.6-14). Much of the parcel has been developed with extensive paved parking lots surrounding the Christian Faith Center. These paved areas are partially surrounded by ornamental green space that were sampled when utilities were not present (Figures G4.6-6 and G4.6-14). The excavations along the northwest corner of OMF 151, adjacent to OMF 152 (Figure G4.6-14), were along a slope composed of multiple different soil types. These soil strata are modern fill events mixed with expected soil horizons per NRCS data (stratified muck) resulting from flood events within the wetlands (OMF 152) overlaying glacial till. Elsewhere on the property, fill of varying thickness was found immediately overlaying sterile glacial sediment (Figures G4.6-14 and G4.6-7).

The far southern aspect of parcel OMF 151, near OMF 180, is a large, mounded platform that has been substantially modified during and after the 1970s. The subsurface investigations on this landform identified soil strata with modern bricks, glass fragments, and tile mixed with charcoal at a depth of 15 to 30 centimeters in SPs 47A, 47B, and 51 (Figures G4.6-12 and G4.6-14 and Attachments G4-3 and G4-4). These excavations and adjacent excavations indicate that the platform was created through multiple modern fill events over glacial till identified at depths between 35 to 45 centimeters. These deposits represent an archaeological deposit. Following discussions with Sound Transit, further investigations at this site (45KI1543) were determined necessary to assess the extent, content, and context of the historic-period deposit (see Section 6.1.1.5 and 6.1.2.2 below; Attachment G4-4).

Other probes within parcel OMF 151 showed expected soils per NRCS data (gravelly-very gravelly sandy loam) and modern fill above glacial till.

ATCRC attempted to complete subsurface testing of parcel OMF 167 (Figure G4.6-14). However, despite an approved right of entry, the property had been gated, locked, and no residents were present for surveyors to request admittance.

Parcel OMF 179 (Figure G4.6-14) is heavily overgrown with blackberry vines and other tall shrubbery to a height of 8 to 12 feet, interspersed with trees (Figure G4.6-7). Three shovel probes revealed modern fill to a depth of 70 centimeters. Modern dumping was noted where portions of this parcel were accessible.

Shovel probes excavated at parcels OMF 187 and OMF 189 revealed a thin modern soil immediately overlaying glacial till (Figure G4.6-14 and Attachment G4-2).

6.1.1.3 Midway Landfill Alternative

Within the Midway Landfill Alternative APE, rights of entry were only acquired for those municipal parcels associated with the Midway Landfill (OMF 8, 9, 24, 28, 30-34, and 43), parcels OMF 44 and OMF 47, and all municipal and state rights-of-way, including the WSDOT right-of-way along I-5 (Figure G4.6-16).

Archaeological survey of the Midway Landfill (parcels OMF 8, 9, 24, 28, 30-34, and 43) was limited to a photographic pedestrian survey of OMF 8 and OMF 9 (Figure G4.6-16). The remainder of the Midway Landfill was previously assessed under the FWLE project (Elliott et al. 2020).

All municipal rights-of-way were examined for suitability for subsurface testing during the pedestrian survey. Each potential location was discounted due to the presence of utilities.

The WSDOT right-of-way along parcels OMF 50, OMF 78, OMF 79, OMF 80, and OMF 90 seemed to be accessible from S 252nd Street (Figure G4.6-16). However, during pedestrian survey, the area proved to be a 30-degree slope covered in thick blackberry thickets, garbage, and thick shrubs (Figure G4.6-15). Due to an inability to safely excavate on a slope of this degree no subsurface testing was undertaken.

A small portion of the WSDOT right-of-way adjacent to parcels OMF 1 and OMF 8 has been previously surveyed by WSDOT (Ives et al. 2017), which identified Pleistocene sediments immediately below the sod in two shovel probes. No cultural resources were identified during this portion of the Ives et al. (2017) survey.

No surface archaeological deposits were identified during the pedestrian survey, and no locations suitable for subsurface archaeological investigations were identified within this APE (Figure G4.6-17).

OMF South

6.1.1.4 OMF South and TDLE Overlap Area

The survey of the OMF South and TDLE overlap area within the OMF South APE was conducted within Belmor, King County Metro South 320th Street Park & Ride, Christian Faith Center, privately owned parcels, city of Federal Way right-of-way, a WSDOT-owned parcel, and WSDOT right-of-way along I-5 (Figure G4.6-22). In addition to the overlap area, survey was also conducted in areas that were within the OMF South APE that were not covered previously due to the presence of standing water during the original survey. The overall topography of the surveyed area was marked by uplands interspersed with low-lying areas adjacent to creeks and natural wetlands. Apart from the topography, survey conditions within this segment were variable depending on the nature of previous disturbances.

Past ground disturbances within this area could be seen in cuts and berms in the right-of-way adjacent to I-5, ditches, artificial wetland ponds, and markings for buried utilities. Examples of these disturbance areas include a golf fairway at Belmor (Figure G4.6-18); marked buried utilities along 24th Avenue S (Figure G4.6-19); a sports field and an adjacent strip of landscaped ground on the Christian Faith Center parcel south of S 336th Street (Figure G4.6-20); and an artificial pond with surrounding gravel road and berm area on a WSDOT parcel at the east end of S 344th Street (Figure G4.6-21).

FIGURE G4.1-22
Archaeological Survey Results
OMF South and TDLE Overlap Area

Relatively undisturbed areas were identifiable by the presence of a mosaic of native vegetation that included Douglas-fir, Pacific madrone, western redcedar, bigleaf maple, vine maple, sword fern, and salal (Figure G4.6-23), which contrasted with the mix of landscape grasses, non-native tree plantings, English ivy, Himalayan blackberry, and Scotch broom that was present in disturbed areas (Figure G4.6-24). Ground-surface visibility was limited throughout the segment by the presence of grasses, forest duff, imported gravels, or dense understory vegetation.

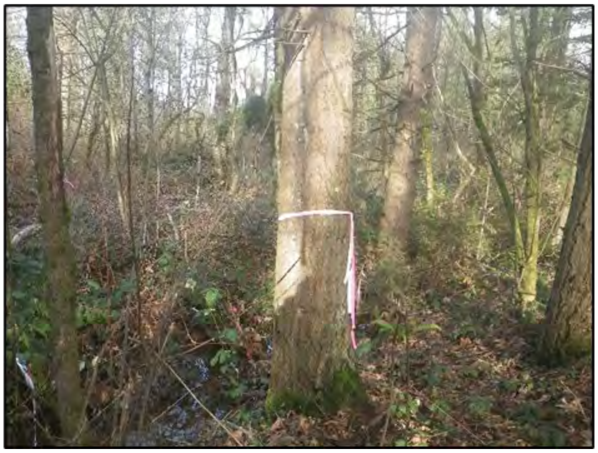

Figure G4.6-23 Wooded area within the WSDOT right-of-way east of the Christian Faith Center property, view north

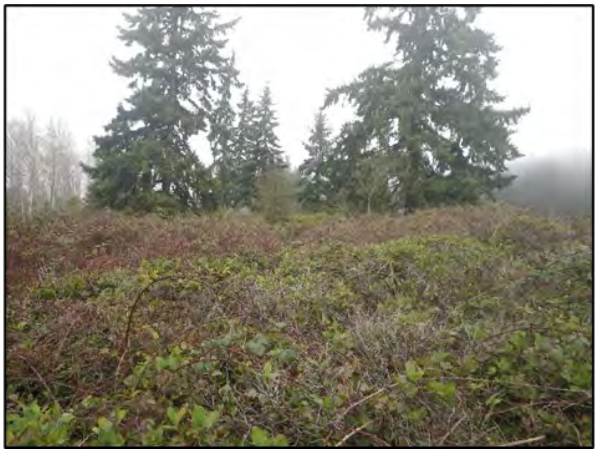

Figure G4.6-24 Disturbed area with Himalayan blackberry cover south of S 344th Street, view north

One archaeological isolate (45KI1583) was identified during the pedestrian survey. The isolate consists of an amber glass beer bottle identified on the ground surface within the WSDOT right-of-way near the base of an embankment west of I-5, approximately 75 meters (246 feet) north of S 336th Street within the area of the mainline. The isolate is discussed in greater detail in Section 6.1.1.7 below.

In total, 186 shovel probes and auger cores were excavated in the OMF South/TDLE overlap area and adjacent portions of the OMF South APE where shovel probes were not previously excavated. The sediments within the shovel probes typically comprised dark brown to dark grayish-brown sandy silt loam in near-surface depths (A horizon) that, at times, was found to overlie a yellowish-brown sandy loam B horizon (Figure G4.6-25). Gravels (rounded and subrounded pebbles and small cobbles) comprised between approximately 5 and 15 percent of the sediment volumes in these near-surface depths. Below the B horizon or, when a B horizon was not present, directly below the A horizon, was a cobbly coarse pale gray to light yellowish-brown sandy loam with a high concentration (30 to 50 percent) of rounded and subrounded pebbles and cobbles consistent with characteristics consistent with glacial sediment. This glacial sediment typically appeared between 30 and 70 centimeters (1 and 2.3 feet) below ground surface.

These overall soil conditions are consistent with the Alderwood gravelly sandy loam that is mapped for the majority of the surveyed area (Snyder 1973:8-10). Exceptions to this pattern were present in shovel probes excavated in the vicinity of drainages, which contain siltier soil in near-surface depths before transitioning to glacial sediments (Figure G4.6-26). Fill and disturbed native soils were present to varying degrees in shovel probes excavated throughout several areas within the South Federal Way Segment, particularly in probes excavated on the edges of the golf course at Belmor, around the perimeter of the King County Metro S 320th Street Park-and-Ride.

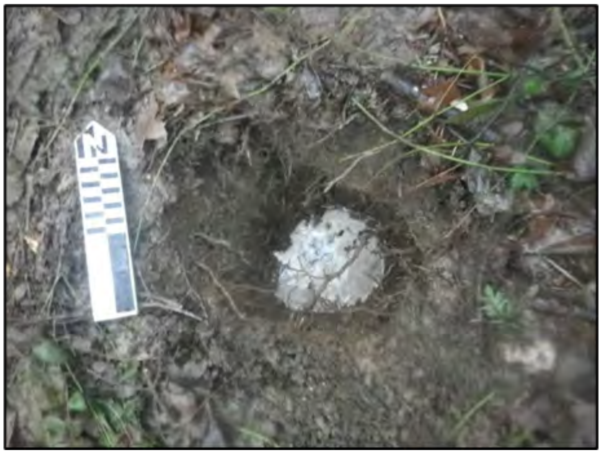

Figure G4.6-26 Shovel probe SP-78 at completion of excavation (80 centimeters [2.6 feet] below ground surface) near Hylebos Creek

6.1.1.5 Site 45KI1542

Site 45KI1542 is a historic concrete slab and perimeter wall foundation located within parcel OMF 152, immediately south of the waterline within the city of Federal Way Stormwater Pond No. 159 (Figures G4.6-7, G4.6-17, and G4.6-27). The foundation is located at a slightly higher elevation than the average water level of the pond, which is regulated by a stormwater filtration system approximately 20 meters north of the foundation. At the time of this survey, the waterline was approximately 1 meter east of the foundation (Figure G4.6-27). The vegetation surrounding and over the foundation consisted of dense thickets of nettles, Himalayan blackberry, salmonberry, partially collapsed and sprawling white oak, Douglas-fir, and Western hemlock (Figures G4.6-28 through G4.6-30). Substantial modern debris, including biohazard materials, are regularly cleared from this area (Rafael 2020 personal communication).

Before additional subsurface survey was conducted near this foundation, historic-period aerial photographs were reviewed in detail for this area. The earliest aerial imagery of this location is from 1936 and illustrates a building in the location of the identified foundation at the southwestern corner of a prairie (King County Map Vault 1936/1937a; Figure G4.6-31). The structure is no longer visible in aerial photographs by 1957 (EarthExplorer 1957a, Figure G4.6-31). The tax assessment records for this area were accessed through the Puget Sound Regional Archives, who hold the historic King County Tax Assessors Records. Of the seven structures listed for the historic tax parcel, one matched the general description and location of the identified foundation (Figure G4.6-32). The likely structure was a 30-foot by 60-foot two-story barn with a concrete foundation, dirt and concrete floors, and a 10-foot by 12-foot concrete single room basement. The records indicate that the barn was built in 1932, owned by John Danielson, and likely demolished between 1940 and 1950, given that it was assessed in 1940 by King County and noted as “gone” during the 1950 assessment.

The concrete perimeter foundation is oriented east-west with a total length of 61 feet, 6 inches (east-west) and a width of 30 feet, 6 inches (north-south). The foundation is a 6-inch footing with an inner lip that defines the outer perimeter of the foundation. The eastern section of the foundation has a 6-inch thick concrete pad that is 10 feet long by 30 feet, 6 inches wide (Figure G4.6-27). The northeastern corner of the foundation was originally a basement and measured 22 feet long by 8 feet, 4 inches wide (Figures G4.6-28 through G4.6-30). Two 8-inch square posts that would have supported a subfloor or interior wall were identified offset from the southern basement wall by 3 feet. These structural details match the general details of the potential structure identified during archival research (Figure G4.6-32).

OMF South

Much of the existing foundation elements show evidence of demolition, with sections having been pushed out of alignment or removed from their original positions (Figures G4.6-28 and G4.6-29). In addition, large concrete slabs have been deposited into the basement area. Some of these slabs have been deposited on top of furniture and cover graffiti (Figure G4.6-29).

A total of 20 shovel probes were excavated on the western and southern sides of the foundation (Figure G4.6-27). Generally, historical fill ranged from 20 to 70 centimeters thick, and it was deposited directly on intact glacially deposited parent material (glacial till) (Attachment G4-2). Contacts between fill and glacial till were sharp and clearly defined, suggesting that the site had undergone substantial land alterations with heavy machinery before the structure was constructed and at least once since the structure was abandoned.

No subsurface precontact or historic artifacts, features, or other cultural deposits were identified during this shove probe survey.

6.1.1.6 Site 45KI1543

Site 45KI1543 is a historic debris scatter in the southern portion of parcel OMF 151, on a highly modified landform situated on the northwest corner of 20th Ave South and South 341st Place intersection. The debris scatter was initially identified in two locations in the northwest and southeast corners of the landform (Figure G4.6-33). The site is located in both the Preferred and South 344th Street alternatives.

Before additional subsurface survey was conducted on the landform, historic aerial photographs were reviewed in detail for this area. The earliest aerial imagery of this location dated to 1936/1937 and illustrates a landscape with partial forest regrowth with winding paths following a clear-cut event. The closest structure at this time was located approximately 200 meters southwest as part of a small farmstead off South 344th Street (Figure G4.6-34) (King County Map Vault 1936/1937a). In the next available imagery from 1957, the site location is completely forested and the closest structures at that time are approximately 200 meters directly south (Figure G4.6-34) (EarthExplorer 1957a). There does not seem to be any access to this site from the developed areas off South 344th Street. There is no visible change in the landscape immediately surrounding the site until the development of the eastern half of South 341st Place in the 1980s. These developments slowly progressed eastward along the roadway, beginning with the clearcutting of parcels adjacent to the road between 1985 to 1987, followed by progressive grading and construction that occurred from 1987 to the early 1990s. Aerial imagery from 1990 shows the landform completely graded, with few clusters of vegetation. The landscape seems to have been completely graded to glacial soils during this time (Figure G4.6-34) (Google Earth 2020).

By 2002, the site had largely become overgrown, with evidence of dumping in aerial imagery. The evidence of dumping becomes more widespread between 2002 and 2005 (Google Earth 2020). In 2005, the site was once again mostly cleared during the preparation for the construction of 20th Ave South and the Christian Faith Center. It is at this time that the roadway shown on the surveyed landform is constructed, and a large pile of boulders appeared in the center of the landform (Google Earth 2020).

The boulders were spread across the landform by 2007, as shown in satellite imagery (Google Earth 2020), likely in conjunction with vegetation clearance. The final visible landscape alteration occurred in the summer of 2016, when a vegetation-removal effort occurred across the western half of the landform (Google Earth 2020).

A very sparse scatter of historical and recent artifacts was observed on the surface during the pedestrian survey of the landform between the two concentrations identified during the subsurface investigations (Figure G4.6-33 and Attachment G4-2). However, surface visibility was approximately 2 percent, with vegetation across the landform consisting of thick grasses, a thicket of Himalayan blackberry, Douglas-fir, Western hemlock, and several non-native decorative species (Figures G4.6-35 and G4.6-36). The landform also has three steep slopes, boulder piles, extensive utility corridors, and a prepared gravel road, which limited excavation locations (Figures G4.6-35 and G4.6-36).

Twenty-eight shovel probes were excavated across the landform. Of these, 24 were excavated across the northwestern quarter of the landform, and the remaining four were excavated in the southeastern corner. A total of 17 shovel probes contained modern or temporally non-diagnostic demolition debris (Figure G4.6-33 and Attachment G4-2). The soils across the site were identified as layers of fill over intact glacially deposited patent material. Glacial till was typically identified at depths between 20 to 30 centimeters below the surface (Figure G4.6-37 and Attachment G4-2).

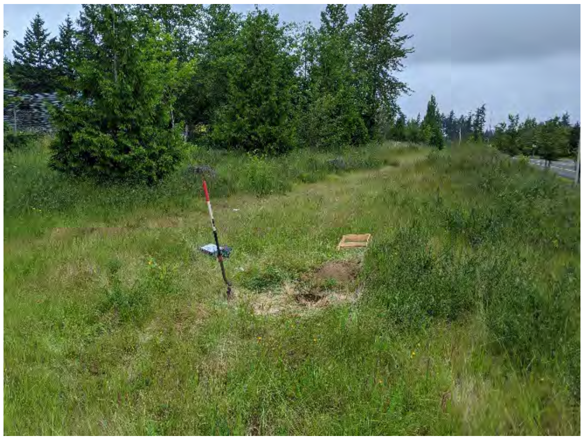

Figure G4.6-36 Overview of Site 45KI1543 landform with utilities and the gravel road, SP02-27, southeast corner, view north-northwest

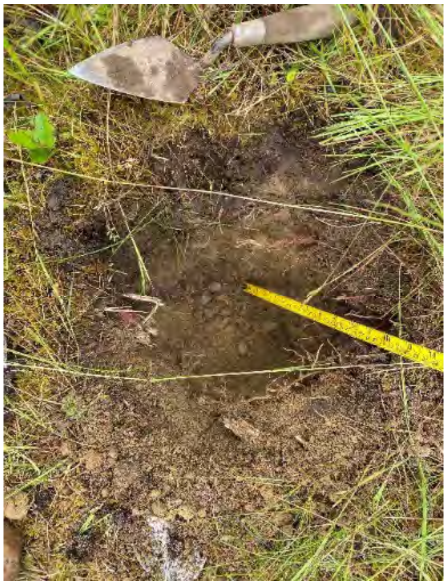

Figure G4.6-37 Typical soil strata, brown fill over orangish-brown glacial till, SP02-06

The artifacts identified include nondiagnostic clear, green, and brown glass fragments; leather scraps, plastics (both hard fragments and films), numerous, machine-made brick fragments, a ceramic tile fragment, culinary ware, ceramic fragments, and cut stone block fragments. Only two metal artifacts were identified: a wire nail and an unidentified metal. None of the artifacts were distinctive or bore any markings that might have provided temporally significant information (Figures G4.6-38 to G4.6-41**)**. All of these artifact types are mixed in the same general soil strata (brown sandy loam with pebbles and cobbles) (Figure G4.6-37, G4.6-42, and G4.6-43, and Attachment G4-2). In most cases (14 of 17), the artifact-bearing layer was present immediately on top of intact, undisturbed glacially deposited parent material with sharp, clearly defined boundaries (Figure G4.6-32 and Attachment G4-2). The other three positive shovel probes had multiple strata of modern fill with various artifact concentrations (Figure G4.6-33 and Attachment G4-2). All identified strata had sharply defined boundaries and contained moderate to high levels of pebbles and cobbles.

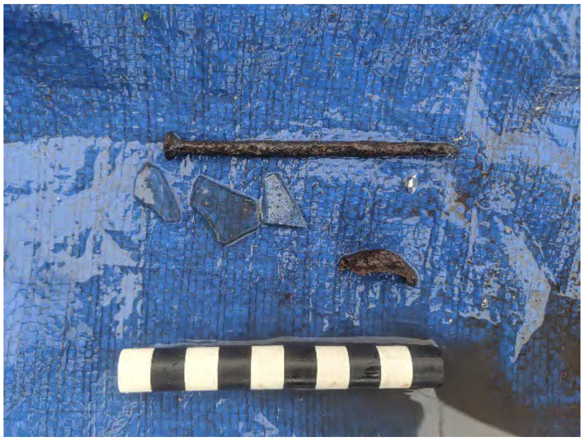

Figure G4.6-38 Metal and glass debris Strata 1, SP02-28

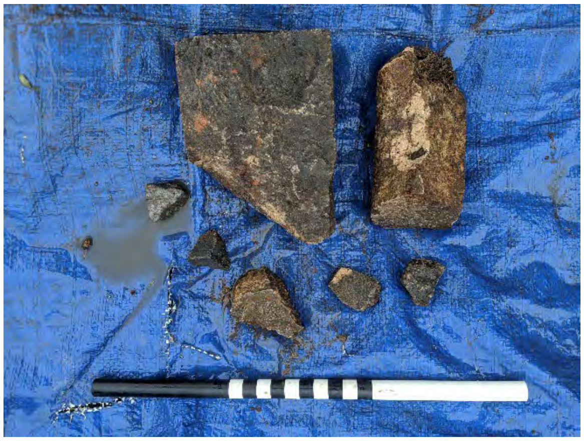

Figure G4.6-39 Cut stone fragments identified Strata 1, SP02-28

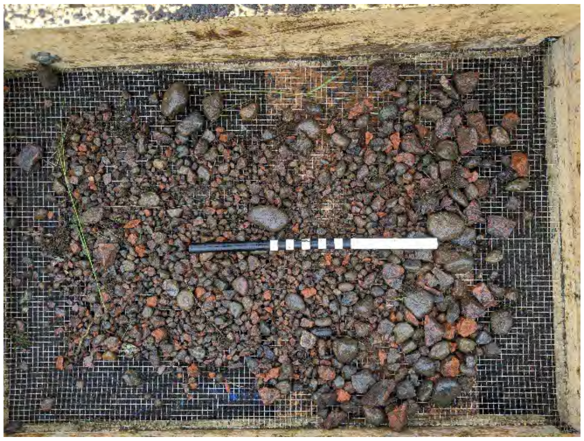

Figure G4.6-40 Mixed gravel and brick fragments Strata 1, SP02-28

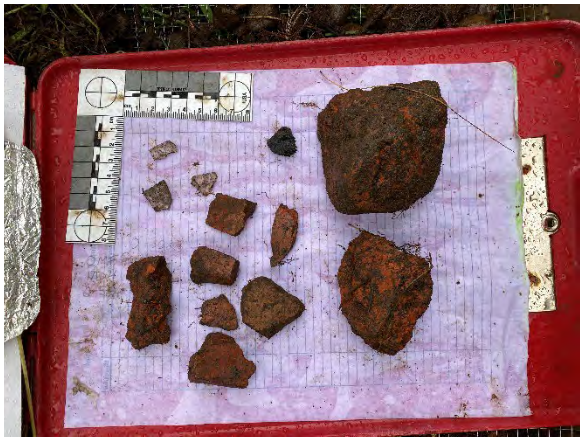

Figure G4.6-41 Glass and brick debris Strata 2, SP02-01

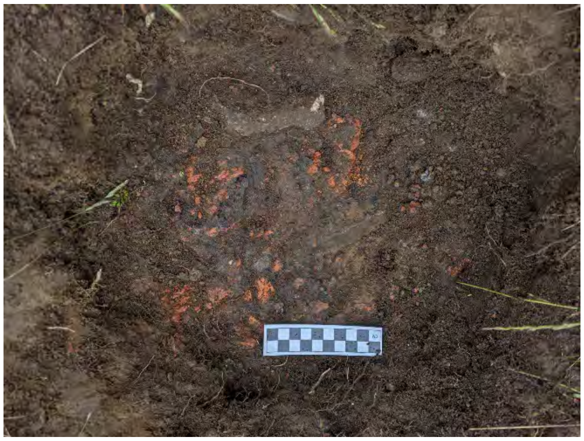

Figure G4.6-42 Typical debris concentration encountered in shovel probes across the site, SP02-28

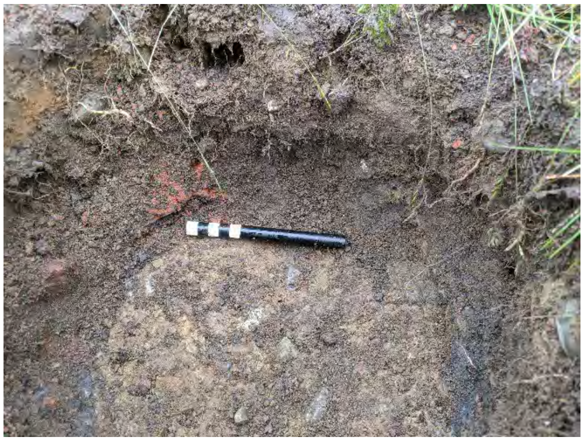

Figure G4.6-43 Detail of typical debris scatter strata with a low, sharply defined stratum boundary, SP02-28

The origin of this debris scatter is unknown. There is no evidence of historic structures near the site from the 1930s through the 1980s that could have been the source. This implies that the debris may have been imported as fill, or the site was used for dumping, following the modern clearance of the site for development. No diagnostic marks were identified on any of the artifacts encountered during the survey of this site. All of the brick fragments identified are hard, evenly fired, and of very fine industrial standard clay. All of them have edges that range from sub-round to very angular, and most are less than five centimeters in size. The cut stone fragments are finished on one face. Some have a finished edge. None have perforations, and the unfinished edges are subangular to angular. All of the glass fragments are less than 2 square centimeters in size and have subangular to angular edges.

6.1.1.7 Isolate 45KI1583

This isolate consists of an amber glass beer bottle identified on the surface within the WSDOT right-of-way near the base of an embankment west of I-5, approximately 75 meters (246 feet) north of S 336th Street (Figure G4.6-46). The bottle contains embossing on its base indicating that it was manufactured by the Northwestern Glass Company in 1966 (Figures G4.6-44 and G4.6-45) (Lockhart et al. 2017). Other modern cans and debris dating from between the mid-1970s to the 1990s were found within approximately 10 meters (33 feet) to the north of the bottle on and near the base of the same embankment below I-5. Six shovel probes and auger cores (SP-71, SP-74, SP-75, SP-76, SP-77, and SP-78) excavated in the immediate vicinity of the 1966 bottle, including four radial shovel probes excavated within 5 meters (16 feet) of the bottle and in the immediate vicinity of the other nearby surface items, contained no historically diagnostic or precontact artifacts. Because none of the other items found in the vicinity of the 1966 bottle were historically diagnostic, the bottle is recorded as an archaeological isolate.

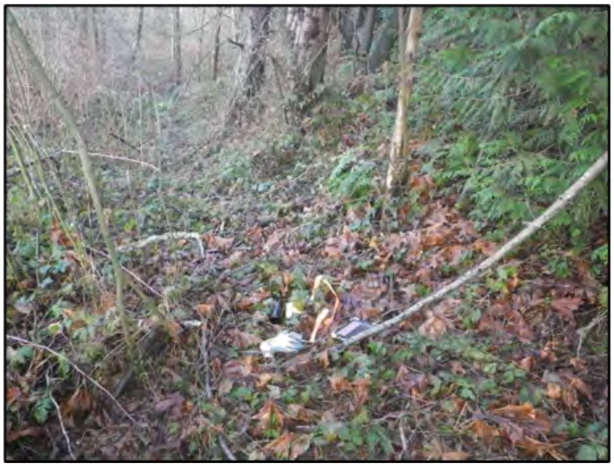

Figure G4.6-44 Isolate 45KI1583 location, view north/northwest

6.1.2.1 Site 45KI1542

Integrity

The site's structural remnants are still in the original construction location, thereby retaining the integrity of location. However, due to the removal and demolition of the building's superstructure, the resource lacks integrity of design, materials, and workmanship. The site no longer retains integrity of setting, feeling, or association, as the site location and its vicinity have been substantially altered since its period of use (1930s to 1940s). The original rural landscape surrounding the site is now heavily urbanized, thereby removing all aspects of the structure's former setting. The associated pasture — once an integral portion of the structure's setting — and its feeling have been substantially altered, and its current use is as a wooded water catchment basin. In sum, the site no longer retains the aspects of integrity that would pertain to its potential significance and NRHP eligibility.

Significance

Located off of SR 99, the foundation is the remains of a barn associated with John Danielson, who owned the barn. It was constructed in 1932, at the beginning of the Great Depression (Figure G4.6-13). It appears that the barn's demolition occurred between 1940 and 1950. The former structure was likely a west-facing gable. The two-story building has a dirt and concrete floor. The foundation was associated with the important economic collapse of the 1930s and the agricultural development of the area from the 1920s through the early 1960s.

While the site is temporally associated with the Great Depression, its absence of integrity precludes it from conveying a clear link to an aspect of this period that may represent a significant pattern in local, state, or national history. The site is therefore recommended to be not eligible for listing in the NRHP under Criterion A. Research has also demonstrated that the resource is not associated with individuals (including John Danielson, who owned the barn) who are significant at a local, state, or national level, and, therefore, the site is recommended to be not eligible for listing in the NRHP under Criterion B. The construction and design of the foundation are not distinct in terms of engineering, architecture, or artistic design, nor does the foundation embody distinctive characteristics of a type, period, or method of construction, or the work of a master. The site is therefore recommended to be not eligible for listing in the NRHP under Criterion C. The foundation is associated with no surface or subsurface artifacts and by itself contributes no significant information regarding rural farming and its social and economic context in this area of Washington during the 1930s, or during any other period and, therefore, the site is recommended to be not eligible for listing in the NRHP under Criterion D.

In summary, site 45KI1542 lacks integrity and does not meet criteria to be considered significant under Criteria A through D of the NRHP and does not meet criteria necessary for listing in the WHR or local registers. In January 2021, DAHP concurred that the site is not eligible for listing in the NRHP.

6.1.2.2 Site 45KI1543

Integrity

This site retains little to no aspect of integrity relevant to its potential significance and NRHP eligibility. The site retains no demonstrable integrity of location, given the characteristics and content of the site’s artifact assemblage — predominantly fragmented construction materials in a disturbed context — incorporated in a secondary depositional context as part of an imported fill matrix. As such, the artifacts at the site also lack integrity of feeling, setting, and association. Indeed, all of the debris shows evidence of having been tumbled and worn. The lack of metals in the debris identified also suggests that a concerted effort was made to remove it before the debris was deposited in its current location. Lastly, the sharp, clear boundaries between multiple soil strata is a typical indication of modern landscape modification strategies, where soils are layered and compacted with heavy machinery. The act of removing, sorting, and redepositing the historic debris from its place of origin has severed its link to a specific location and setting. Given the absence of any built structures or features at the site, integrity of design, materials, and workmanship do not pertain to the evaluation of this site.

Eligibility

The site’s historic artifacts appear to be structural remnants; however, they are in a secondary depositional context and amongst materials deposited as fill. The site has no demonstrable connection to a pattern of events to be considered significant under Criterion A, nor is it associated with a prominent person who would make it significant under Criterion B. The site also lacks any features that would make it significant under Criterion C. The site’s cultural material contributes no new information about local, regional, or national history that would make the site potentially significant under Criterion D.

In summary, site 45KI1543 lacks integrity and does not meet criteria to be considered significant under Criteria A through D of the NRHP and does not meet criteria necessary for listing in the WHR or local registers. In January 2021, DAHP concurred that the site is not eligible for listing in the NRHP.

6.1.2.3 Isolate 45KI1583

Integrity

Isolate 45KI1583 appears to retain integrity of location and potentially retains integrity of setting, feeling, and association, given that the immediate surroundings of the isolate (WSDOT right-of-way adjacent to I-5) have likely changed little since the artifact was deposited. As the isolate is not associated with built structures or other features, integrity aspects of design, materials, and workmanship do not pertain to the evaluation of the isolate.

Eligibility

This isolated beer bottle has no demonstrable connection to a pattern of events to be considered significant under Criterion A, nor is it associated with a prominent person that would make it significant under Criterion B. The isolate also lacks any features that would make it significant under Criterion C. This artifact, by itself, contributes no new information about local, regional, or national history and is therefore not significant under Criterion D.

HRA and ATCRC recommends that Isolate 45KI1583 is not eligible for listing in the NRHP or the WHR. Sufficient information has been gathered from the site to evaluate it under National

Register Criteria A, B, C, and D. In May 2023, DAHP concurred that the isolate is not eligible for listing in the NRHP.

6.2 Historic-Period, Built-Environment Survey Results

Using the methods described above (Section 5.2), HRA identified a total of 86 historic-period, built-environment resources that could qualify for listing in the KCRHP, WHP, and NRHP within the APE requiring survey and inventory. A map of surveyed resources is found in Attachment G4-4. As noted above, resources surveyed and inventoried for the OMF South project included historic-period, built-environment resources that will be 40 years old or older at the time of project construction (i.e., 2025) or those built in or before 1985, minus those meeting clearly defined exemptions (Section 5.2). HRA found that 58 of the 86 historic-period resources are old enough to qualify for listing in the NRHP; survey results were recorded in HPIs and are included as Attachment G4-5. The remaining 28 surveyed resources were old enough to meet minimum age criteria for KCRHP eligibility consideration and were evaluated under King County criteria but were not recorded in WISAARD due to age restrictions, as per consultation with DAHP.

Table G4.6-1 lists the surveyed resources in the OMF South APE. HRA provided an initial recommendation that none of the resources are eligible for listing in the NRHP under Criteria A through D. These recommendations are advisory and can inform the lead agency's determinations of eligibility for surveyed resources. In a letter dated October 27, 2023, FTA determined that the none of the resources listed in Table G4.6-1 are eligible for listing in the NRHP (see Attachment G4-6, Tribal and Agency Coordination). In addition, based on the survey results, HRA recommends that no built-environment resources surveyed for the OMF South Project are eligible for the WHR or KCRHP as historic properties.

7 CONCLUSIONS AND RECOMMENDATIONS

7.1 Preferred Alternative

7.1.1 Archaeological Recommendation

Archival research has not identified any archaeological resources within the Preferred Alternative APE that are listed in or eligible for listing in the NRHP, WHR, or KCRHP. ATCRC and HRA identified three historic-period archaeological resources within the area surveyed (Sites 45KI1542 and 45KI1543; and Isolate 45KI1583). ATCRC and HRA recommended that the two sites lack integrity and are not eligible for listing in the NRHP, WHR, and KCRHP. In January 2021, DAHP concurred that neither site is eligible for listing in the NRHP. ATCRC and HRA recommend the isolate does not meet any criteria for eligibility in the NRHP, WHR, or KCRHP. In May 2023, DAHP concurred that Isolate 45KI1583 is not eligible for listing in the NRHP. Should the project be modified from that described in Section 1, additional archaeological analysis may be necessary.

ATCRC and HRA recommend adoption of an Inadvertent Discovery Plan (IDP) prior to ground disturbance activities in the event that previously unidentified archaeological resources or human remains are discovered during construction. An IDP has been developed for the project and would be implemented during construction (see Attachment G4-7). The purpose of the IDP is to minimize the risk of damage to currently unknown archaeological resources by providing appropriate procedures for addressing any inadvertent discoveries of human remains or archaeological resources during ground-disturbing work. Sound Transit would coordinate with SHPO and Tribes to review the plan prior to implementation. A contractor orientation would also be prepared to familiarize construction crews with IDP procedures and the kinds of resources that may be encountered during construction.

7.1.2 Historic, Built-Environment Properties Recommendations

Archival research indicated that there are no previously identified historic properties listed in or eligible for listing in the NRHP, WHR, or KCRHP located in the APE for the Preferred Alternative, with the exception of the Tacoma-Covington No. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines. Under separate evaluations, BPA and FTA determined that the OMF South project would have no adverse effect to the transmission lines under Section 106, a finding with which SHPO has concurred (see Attachment G4-6). Additionally, FTA determined, and SHPO concurred, that no historic-period, built-environment resources surveyed for the OMF South project are eligible for listing in the NRHP. Based on the survey results, HRA recommends that no built-environment resources surveyed for the OMF South Project are eligible for the WHR or KCRHP as historic properties. Should the project be modified from that described in Section 1, additional historic-period built-environment analysis may be necessary.

7.2 South 344th Street Alternative

7.2.1 Archaeological Recommendations

Archival research has not identified any archaeological resources within the South 344th Street APE that are listed in or eligible for listing in the NRHP, WHR, or KCRHP. ATCRC identified one historic archaeological resource (45KI1543) within the area surveyed. However, ATCRC and HRA are recommending that this site lacks integrity and is not eligible for listing in the NRHP, WHR, and

KCRHP. Should the project be modified from that described in Section 1 additional archaeological analysis may be necessary.

ATCRC and HRA recommend adoption of an IDP prior to ground disturbance activities in the event that previously unidentified archaeological resources or human remains are discovered during construction. An IDP has been developed for the project and would be implemented during construction (see Attachment G4-7). Sound Transit would coordinate with SHPO and Tribes to review the plan prior to implementation. A contractor orientation would also be prepared to familiarize construction crews with IDP procedures and the kinds of resources that may be encountered during construction.

7.2.2 Historic, Built-Environment Properties Recommendations

Archival research indicated that there are no previously identified historic properties listed in or eligible for listing in the NRHP, WHR, or KCRHP located in the APE for the South 344th Street Alternative, with the exception of the Tacoma-Covington No. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines. Under separate evaluations, BPA and FTA determined that the OMF South project would have no adverse effect to the transmission lines under Section 106, a finding with which SHPO has concurred (see Attachment G4-6). Additionally, FTA determined, and SHPO concurred, that no historic-period, built-environment resources surveyed for the OMF South project are eligible for listing in the NRHP. Based on the survey results, HRA recommends that no built-environment resources surveyed for the OMF South Project are eligible for the WHR or KCRHP as historic properties. Should the project be modified from that described in Section 1, additional historic-period, built-environment analysis may be necessary.

7.3 Midway Landfill Alternative

7.3.1 Archaeological Recommendations

Archival research has not identified any archaeological resources within the Midway Landfill APE that are listed in or eligible for listing in the NRHP, WHR, or KCRHP. Additionally, ATCRC did not identify any archaeological resources within the area surveyed for the Midway Landfill APE. As such, archaeological resources will not be impacted by this alternative. Should the project be modified from that described in Section 1, additional archaeological analysis may be necessary.

ATCRC and HRA recommend the adoption of an IDP prior to ground disturbance activities in the event that previously unidentified archaeological resources or human remains are discovered during construction. An IDP has been developed for the project and would be implemented during construction (see Attachment G4-7). Sound Transit would coordinate with SHPO and Tribes to review the plan prior to implementation. A contractor orientation would also be prepared to familiarize construction crews with IDP procedures and the kinds of resources that may be encountered during construction.

7.3.2 Historic, Built-Environment Properties Recommendations

Archival research indicated that there are no previously identified historic built-environment properties listed in or eligible for listing in the NRHP, WHR, or KCRHP located in the APE for the Midway Landfill Alternative. Additionally, based on survey results, FTA determined, and SHPO concurred, that no historic-period, built-environment resources surveyed for the OMF South project are eligible for listing in the NRHP. Based on the survey results, HRA recommends that no built-environment resources surveyed for the OMF South Project are eligible for the WHR or KCRHP as historic properties. Should the project be modified from that described in Section 1, additional historic-period, built-environment analysis may be necessary.

7.4 Summary of Recommendations and Effects

ATCRC and HRA do not recommend any archaeological or historic-built environment resources for eligibility in the NRHP, WHR, or KCRHP for any of the build alternatives. However, ATCRC and HRA recommend adoption of an Inadvertent Discovery Plan (IDP) for all build alternatives prior to ground disturbance activities in the event that previously unidentified archaeological resources or human remains are discovered during construction.

In a letter dated October 27, 2023, FTA determined that the project would have no adverse effect to resources that are listed on, or eligible for the NRHP within the APE. SHPO concurred with this determination in a letter dated October 31, 2023 (see Attachment G4-6, Tribal and Agency Correspondence).

OMF South: ATCRC Shovel Probe Log – First Field Session, February 2020

SP	Field ID	Strata #	Depth (cm)	Description	Cultural Materials	Notes
1	NP6	1	28	Grey brown silty loam, 5% rounded gravels.	Negative	
		2	38	Light brown fine sandy loam, with 5% round gravels, concrete fragments.	Negative	
		3	48	Yellowish brown silty loam, 15% rounded to sub-rounded gravel - cobbles.	Negative	Glacial
		Lat (°N): -122.307762		Long (°W): 47.300495	Termination: Glacial Material	
2	NP5	1	10	Loose dry non-plastic dark brown sandy loam with roots and 2% gravel. Gradual smooth transition.	Negative	
		2	25	Loose dry non-plastic brown sandy loam with roots 4% gravel - cobbles. Smooth sharp transition.	Negative	Charcoal 15 35-40cm. Root burn.
		3	50	Loose soil non-plastic tan orange sandy loam with roots and 10% gravel - cobbles. Smooth sharp transition.	Negative	
		4	64	Yellowish brown silty loam, 15% rounded to sub-rounded gravel - cobbles.	Negative	Glacial
		Lat (°N): 47.300473		Long (°W): -122.308160	Termination: Glacial Material	
3	NP4	1	19	Grey brown silty loam, with 15% rounded to sub-rounded gravel - cobbles and rootlets.	Negative	
		2	38	Yellowish brown silty loam, 15% rounded to sub-rounded gravel - cobbles.	Negative	Glacial
		Lat (°N): 47.300528		Long (°W): -122.308511	Termination: Glacial Material	
4	NP3	1	18	Grey brown silty loam, 15% rounded to sub-rounded gravel and cobbles.	Negative	
		2	29	Yellowish brown silty loam, 15% round to sub-rounded gravel - cobbles.	Negative	Glacial
		Lat (°N): 47.300473		Long (°W): -122.308833	Termination: Glacial Material	
5	NP2	1	10	Loose hard dry non plastic dark brown sandy loam with many roots, 3% gravel. Clear smooth transition.	Negative	
		2	30	Dry loose non-plastic brown sandy loam, with many roots 5% gravel - cobbles. Sharp smooth transition.	Negative	
		2	40	Grey-brown sandy loam, with many rounded to sub-round gravels and cobbles.	Negative	Glacial
		Lat (°N): 47.300502		Long (°W): -122.309221	Termination: Glacial Material	
6	NP1	1	5	Brown silty loam, 10% rounded gravels. Rootlets.	Negative	
		2	22	Brown silty loam, mottled with grey silty loam, with >5% gravels.	Negative	
		3	44	Yellowy brown fine sandy loam with 15% round - sub-rounded gravel and cobbles.	Negative	Glacial
		Lat (°N): 47.300515		Long (°W): -122.309532	Termination: Glacial Material	

OMF South: ATCRC Shovel Probe Log – First Field Session, February 2020 (continued)

SP	Field ID	Strata #	Depth (cm)	Description	Cultural Materials	Notes
7	NC1	1	18	Dark brown soft moist loam, with 5% gravel and cobbles.	Negative	
		2	40	Grey brown moist semi-plastic sand-silt with clay pockets and 5% cobbles and gravel and charcoal.	Negative	
		3	60	Very loose moist non-plastic unsorted, brown and grey silty sand with 5% gravels and cobbles.	Negative	Auger beginning at 90cmbs
		4	105	Very loose, moist, non-plastic, unsorted, brown, grey, and orange silty sand with 5% gravels and cobbles.	Negative	
		5	110	Compact grey silt weathered to orange with >5% gravels.	Negative	Possible glacial material
		Lat (°N): -122.310115		Long (°W): 47.300388	Termination: Auger refusal	
8	NC2	1	25	Dark brownish loam with plenty of organics, with 5% gravels.	Negative	
		2	27	Red loam. Decomposed cedar and bark.	Negative	
		3	55	Grey brown plastic and soft silt and coarse sand with 10% gravel and 5% cobble.	Negative	
		4	62	Grey and yellow brown silt and coarse sand with 10% gravels and cobbles.	Negative	Glacial
		Lat (°N): -122.310144		Long (°W): 47.300117	Termination: Glacial material	
9	NC6	1	10	Humic layer. Brown loose loam with 10% round gravels.	Concrete 10+ cm	
		Lat (°N): -122.310060		Long (°W): 47.299762	Termination: Concrete, possible utility	
10	NC3	1	17	Dark brown soft and somewhat plastic silt/loam.	Negative	Fill
		2	40	Light brown dry soft and semi-plastic clayey silt with 5% pebbles.	Negative	Fill
		3	50	Gray slightly dry soft and semi-plastic clayey silt.	Negative	Fill
		4	55	Hard brown dry silt and coarse sand with 10% sub-rounded gravel.	Negative	Fill
		5	105	Grey highly plastic very soft clay with silt at top. Ground water at top.	Negative	
		Lat (°N): -122.310582		Long (°W): 47.299729	Termination: >100 cm	
11	NC4	1	3	Black brown loam with loose organics.	Negative	
		2	25	Grey brown dry hard semi-plastic silty/clay with 5% gravels.	Negative	
		3	44	Grey brown and red brown silty/clay and burnt root.	Negative	
		4	50	Grey dry soft semi-plastic silty loam with >5% gravels.	Negative	
		5	54	Orange brown coarse sand and silt with 15% gravels.	Negative	Glacial
		Lat (°N): -122.310687		Long (°W): 47.299482	Termination: Glacial material	

OMF South: ATCRC Shovel Probe Log – First Field Session, February 2020 (continued)

SP	Field ID	Strata #	Depth (cm)	Description	Cultural Materials	Notes
12	NC5	1	5	Humic layer. Loose dark brown loam.	Negative	
		2	45	Very loose soft non-plastic dry brown silt with fragments of hard grayish silt and 5% rounded gravel.	Negative	
		3	90	Very loose soft dry non-plastic silt with 5% rounded gravel.	Negative	
		4	95	Soft grey moist and highly plastic silty clay.	Negative	
		5	100	Unsorted, somewhat firm, moist, semi-plastic silt with 10% gravels.	Plastic film	
		Lat (°N): -122.311027		Long (°W): 47.299164	Termination: Depth	
13	NC7	1	5	Humic layer. Brown loose loam with lots of organics.	Negative	
		2	55	Brown light brown loose semi coarse sand with 10% round gravels.	Negative	Construction fill.
		Lat (°N): -122.310746		Long (°W): 47.298896	Termination: Boulder	
14	NC8	1	25	Humic layer. Dark brown loam with lots of organics and 5% rounded gravels.	Negative	
		2	55	Grey brown very compact coarse loam and sand with 10% rounded gravels.	Negative	Glacial
		Lat (°N): -122.311013		Long (°W): 47.298673	Termination: Glacial material	
15	NC9	1	6	Dark brown soft slightly plastic loam.	Negative	
		2	25	Dry loose non-plastic tan/grey sandy loam, 15% sharp gravels and cobbles.	Negative	Glacial
		Lat (°N): -122.311195		Long (°W): 47.298475	Termination: Glacial material	
16	NC17	1	10	Dark brown loose soft loam with 5% gravel.	Negative	On Levee
		2	50	Brown loose loam with 5% round to angular gravel.	Negative	
		3	65	Grey very compact semi-coarse sand with 10% sub-rounded gravels.	Negative	Glacial Outwash
		Lat (°N): 47.299613		Long (°W): -122.312386	Termination: Extreme compaction, boulder (Glacial Material)	
17	NC16	1	7	Humic layer. Dark brown loam.	Negative	On Levee
		2	40	Very loose brown dry and non-plastic sandy silt with 8% gravel to cobbles.	Negative	
		3	52	Dry loose non-plastic tan/grey sandy loam, 15% gravels and cobbles.	Negative	Glacial
		Lat (°N): 47.299137		Long (°W): -122.312447	Termination: Glacial material	
18	NC10	1	25	Brown compact loam with 15% sub-angular gravels.	Negative	
		2	40	Orange brown very compact silty loam with 10% rounded gravels and cobbles.	Negative	Glacial
		Lat (°N): 47.298578		Long (°W): -122.312419	Termination: Glacial material	

OMF South: ATCRC Shovel Probe Log – First Field Session, February 2020 (continued)

SP	Field ID	Strata #	Depth (cm)	Description	Cultural Materials	Notes
19	NC11	1	5	Humic layer. Soft moist dark brown loam.	Negative	
		2	18	Dark brown soft and non-plastic loose silt with 8% coarse sand to small rounded cobbles.	Negative	
		3	26	Orange brown unsorted silt to large rounded pebbles.	Negative	Glacial
		Lat (°N): 47.298557		Long (°W): -122.312693	Termination: Glacial material	
20	NC12	1	10	Humic layer. Brown dark loam with >5% gravels.	Negative	
		2	20	Loose brown loam with 5% gravels.	Negative	
		3	30	Brown and red sand with 10% rounded gravels.	Negative	Glacial
		Lat (°N): 47.299120		Long (°W): -122.313082	Termination: Glacial material	
21	NC13	1	15	Humic layer. Dark brown loam.	Negative	
		2	62	Loose dark brown dry and non-plastic silt to sand with 5% rounded gravel with occasional slate fragments. Lens of firm grey clay between 42-54 and 35-39 disrupted halfway through the probe.	Negative	
		3	72	Non plastic very compact very coarse sand with 15+% gravels.	Negative	Compacted stream bed
		Lat (°N): 47.299358		Long (°W): -122.313077	Termination: Refusal: Cobbles	
22	NC14	1	20	Humic fill. Brown loose fill.	Negative	
		2	70	Dark brown compact fill.	Negative	
		Lat (°N): 47.299387		Long (°W): -122.312791	Termination: Refusal- Cobbles	
23	NC15	1	10	Dark brown loose loam with >5% gravels and rootlets.		
		2	30	Brown loose loam with 5% rounded gravels.	Red roof tile. Not historic.	
		3	45	Red-brown loose loam with 5% rounded gravels.	Negative	
		4	50	Orange brown coarse sand with 5-10% gravels.	Negative	Glacial
		Lat (°N): 47.299124		Long (°W): -122.312808	Termination: Glacial material	
24	NP14	1	5	Blackish brown silty loam, with many rootlets.	Negative	
		2	15	Grey fine sandy loam, 15% sub-rounded to sub-angular gravel - cobbles, very compact.	Negative	Fill. Highly compacted access roadway
		Lat (°N): 47.298583		Long (°W): -122.312045	Termination: Roadway	
25	NP15	1	20	Brown silty loam, many rootlets.	Negative	
		2	24	Yellowish brown fine sandy loam with 15% rounded to sub-rounded gravel - cobbles.	Negative	Glacial
		Lat (°N): 47.298337		Long (°W): 47.298337	Termination: Glacial material	
26	NP16	1	14	Grey fine sandy loam, 15% sub-rounded to sub-angular gravel - cobbles, very compact. Covered in light vegetation.	Negative	Compacted glacial covered in light vegetation
		Lat (°N): 47.298073		Long (°W): -122.312004	Termination: Glacial material	

OMF South: ATCRC Shovel Probe Log – First Field Session, February 2020 (continued)

SP	Field ID	Strata #	Depth (cm)	Description	Cultural Materials	Notes
27	NP17	1	6	Humic layer loose dry non-plastic dark brown sandy loam, with 2% gravel.	Negative	
		2	57	Grey fine sandy loam, 15% sub-rounded to sub-angular cobbles and gravels, very compact.	Negative	Fill
		3	60	Grey-brown sandy loam, with many rounded to sub-round gravels and cobbles.	Negative	Glacial
		Lat (°N): 47.298381		Long (°W): -122.311645	Termination: Glacial material

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
1	50	0–30: 10YR 2/2; loose sandy loam with 10% 3–5 cm rounded gravel and many cedar roots; clear basal contact 30–40: Broken concrete and groundwater; clear basal contact 40–50: 10YR 3/2; fine sandy loam with 10% 5–10 cm rounded gravel *Terminated due to inhibitive cobbles and standing water*	No recovery
2	68	0–3: 7.5YR 2.5/1; black sandy loam and moss; clear basal contact 3–68: 7.5YR 5/1, 7.5YR 6/1; compact sand and gravel fill with subangular to rounded cobbles up to 20 cm; contains large pockets of mostly clean medium to coarse sand; fill to 68+ cmbs; slow groundwater seepage up to at least 65 cmbs *Terminated due to inhibitive cobbles*	No recovery
3	75	0–75: 10YR 4/1; compact very coarse sand with 25–50% 5–10 cm angular to rounded gravels, increasing with depth *Terminated due to inhibitive cobbles*	No recovery
4	120	0–20: 10YR 2/2; loam with 5% 3–5 cm subrounded gravel; clear basal contact 20–78: 10YR 3/6; loose sandy loam with 15% 3–5 cm subrounded gravel and 10–15 cm rounded cobbles; clear basal contact 78–120: 10YR 5/6; compact glacial sediments up to 15 cm subrounded gravel, increasing density and clast size with depth *Augered from 100 cmbs *Terminated due to inhibitive boulder*	No recovery
5	100	0–90: 10YR 4/3; sandy silt construction fill with abundant angular and subangular pebbles and small cobbles; many roots from 0–70 cm, one band of 10YR 4/2 fill at 20–25 cm; clear basal contact 90–100: Olive-brown glacial outwash; coarse sandy silt with common subrounded and subangular pebbles and small cobbles *Terminated due to inhibitive cobbles in glacial sediment*	80–90 cmbs: Temporally non-diagnostic metal/rubber fragment
6	77	0–20: 10YR 2/2; loose sandy loam with 10% rounded gravel; clear basal contact 20–40: Compact reddish sandy loam with 15% rounded gravel; gradual basal transition 40–77: 10YR 5/3; very compact sandy loam with 15% rounded gravel *Terminated due to inhibitive cobbles within glacial sediment*	No recovery
7	54	0–10: 10YR 2/2; loose sandy loam with 10% 3–5 cm rounded gravel; clear basal contact 10–54: 10YR 5/3; increasingly compact sandy loam with 15% 3–10 cm subangular gravel *Terminated due to inhibitive cobbles*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
8	60	0–12: 10YR 2/2; loose sandy loam with 10% 3–5 cm rounded gravel; clear basal contact 12–25: 10YR 5/5; fine sand; clear basal contact 25–60: 10YR 5/3; increasingly compact sandy loam with 15% 3–10 cm subangular gravel *Terminated due to inhibitive cobbles*	No recovery
9	55	0–30: 10YR 2/2; wet loam with 10% 3–5 cm rounded gravel; clear basal contact 30–55: 10YR 5/3; compact glacial sediments up to 10 cm rounded gravel with groundwater seepage *Terminated due to auger refusal in glacial and standing water*	No recovery
10	35	0–3: Black wood chips; clear basal contact 3–23: 7.5YR 3/2; wet plastic silt; clear basal contact 23–35: 2.5Y 7/3; compact glacial clay through 10 cm rounded pebbles; unsorted and plastic with groundwater saturation and rapid seepage *Augered from 24.5 cmbs *Terminated due to auger refusal in glacial and standing water*	No recovery
11	45	0–10: 10YR 2/2; loose, very clumpy loam with 10% 3–5 cm rounded gravel; clear basal contact 10–45: 10YR 5/3; very compact glacial sediments up to 10 cm rounded to subangular gravel *Terminated at depth in glacial sediment*	No recovery
12	50	0–40: 7.5YR 4/2; compact 5 cm angular gravel fill; fill to 40 cmbs; clear basal contact 40–50: 2.5Y 7/3; compact glacial clay through 15 cm rounded cobbles; unsorted and plastic *Terminated due to inhibitive cobbles in glacial sediment*	No recovery
13	50	0–40: 7.5YR 4/2; soft, wet loam with rounded cobbles up to 20 cm; clear basal transition 40–50: 2.5Y 7/3; compact glacial clay through 20 cm rounded cobbles with groundwater saturation and rapid seepage *Augered from 42 cmbs *Terminated due to inhibitive cobbles and standing water*	No recovery
14	100	0–25: 10YR 4/2; loose clumpy sandy loam with 10% 3–5 cm rounded gravel; clear basal contact 25–100: 10YR 5/3; compact glacial sediments up to 12 cm rounded to subangular gravel *Terminated at target depth in glacial sediment*	No recovery
15	52	0–6: 7.5 YR 3/2; roots and silty humic layer; gradual basal transition 6–45: 7.5YR 4/2; subrounded gravelly loam; clear basal contact 45–52: 2.5Y 7/3; compact glacial clay through 8 cm rounded gravel *Augered from 35 cmbs *Terminated due to inhibitive cobbles*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
16	45	0–20: 10YR 4/2; loose clumpy loam with 10% 3–5 cm rounded gravel; clear basal contact 20–45: 10YR 5/3; compact glacial clay through 12 cm subrounded to subangular pebbles *Terminated due to inhibitive cobbles in glacial sediment*	No recovery
17	47	0–23: Subangular cobbles to boulders up to 25 cm diameter with accumulated conifer needles; original trench surfacing to 27 cmbs; clear basal contact 23–27: 7.5YR 4/2; subangular cobbles to 25 cm boulders in thin loam matrix; clear basal contact 27–47: 2.5Y 7/3; compact glacial clay through 10 cm rounded cobbles *Terminated due to inhibitive cobbles in glacial sediment*	No recovery
18	70	0–20: 10YR 4/2; loose sandy loam with 10% 3–5 cm rounded gravel; clear basal contact 20–70: 10YR 5/3; compact glacial sediments up to 12 cm subrounded to subangular pebbles *Terminated due to inhibitive cobbles in glacial sediment*	No recovery
19	58	0–15: 2.5YR 3/2; humic layer and roots; gradual basal transition 15–58: 7.5Y 4/4; brown loam with 20% < 7 cm rounded gravel, two < 27 cm boulders, and large tree roots *Augered from 40 cmbs *Terminated due to inhibitive cobbles and tree roots*	No recovery
20	70	0–16: 10YR 2/2; loose clumpy loam with 10% 3–5 cm rounded gravel; clear basal contact 16–27: Large boulder 27–70: 10YR 5/3; compact glacial sediments up to 10 cm subrounded to subangular pebbles *Terminated due to inhibitive cobbles in glacial sediment*	No recovery
21	100	0–25: 10YR 2/2; loose sandy loam with 5% 3–5 cm rounded gravel; clear basal contact 25–100: 10YR 5/3; loose to increasingly compact coarse sandy glacial sediments *Augered from 98 cmbs *Terminated at auger refusal in glacial sediment*	No recovery
22	39	0–17: 7.5YR 3/2; loam; clear basal contact 17–39: 2.5Y 6/3; compact glacial clay through 10 cm rounded cobbles *Terminated at depth in glacial*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
23	91	0–22: 7.5YR 3/2; loam and roots; clear basal contact 22–90: 7.5YR 5/4, tinting to 2.5Y 6/3 with depth; silty sand with minor clay and 5–10% 1–8 cm rounded gravel; clear basal contact 90–91: Compact unsampled gravel or pebble surface with groundwater seepage *Augered from 49 cmbs *Terminated due to inhibitive gravel density, presumed glacial sediment*	No recovery
24	40	0–17: 7.5YR 3/2; loose loam with roots; clear basal contact 17–36: 7.5YR 4/2; sandy loam with > 20% rounded gravel up to 6 cm; clear basal contact 36–40: 2.5Y 6/3; compact glacial clay to rounded cobbles, attempted auger from 40 cm *Terminated due to inhibitive cobbles in glacial*	No recovery
25	35	0–17: 7.5YR 3/2; loose loam and roots; gradual basal transition 17–35: 7.5YR 3.5/2 to 7.5YR 4/2, tinting with depth; sandy loam with > 20% cobbles up to at least 6 cm *Terminated due to inhibitive cobbles*	No recovery
26	86	0–15: 7.5YR 4/1; loam; messy basal contact 15–65: 7.5YR 4/4; sandy loam with up to 15 cm rounded gravel and cobbles; clear basal contact 65–86: 2.5Y 6/3; wet glacial silt through 7 cm rounded gravel and cobbles of unknown size *Augered from 55 cmbs *Terminated due to inhibitive cobbles*	5 cmbs: Modern black plastic trash bag fragment
27	43	0–21: 7.5YR 3/1; gravelly loam with a 23 cm subrounded cobble; clear basal contact 21–43: 2.5Y 7/3; compact glacial clay through 25 cm rounded cobbles; soil is plastic even when relatively dry *Terminated at depth in glacial sediment*	5 cmbs: Temporally non-diagnostic paper and white plastic debris within top
28	95	0–16: 10YR 3/3; loose sandy loam with 5% 3–5 cm rounded gravel; clear basal contact 16–45: 10YR 4/3; very loose fine sandy loam; clear basal contact 45–55: 10YR 5/6; loose sandy loam with 10% 3–10 cm rounded gravel; gradual basal transition 55–95: 10YR 5/4; compact glacial sediments with 15% 5–12 cm rounded cobbles *Terminated due to refusal in glacial sediment*	20–40 cmbs: Temporally non-diagnostic black plastic trash bag containing trash
29	75	0–19: 7.5YR 4/1; loam; slightly messy basal contact 19–55: 7.5YR 4/4; sandy loam with up to 8 cm rounded gravel; clear basal contact 55–75: 2.5Y 6/3; compact glacial clay through 8 cm rounded gravel and cobbles of unknown size *Augered from 52 cmbs *Terminated due to inhibitive cobbles*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
30	80	0–25: 10YR 3/3; loose clumpy sandy loam with 5% 3–5 cm rounded gravel; clear basal contact 25–60: 10YR 6/1; loose to soft sandy loam with 10% 3–5 cm rounded gravel; gradual basal transition 60–80: 10YR 5/4; compact glacial sediments with 15% 3–10 cm rounded gravel *Terminated due to auger refusal in glacial sediment*	No recovery
31	70	0–17: 7.5YR 4/1; loam and roots; messy basal contact 17–60: 7.5YR 4/4; sand and up to 6 cm gravel with silt; clear basal contact 60–70: 2.5Y 6/3; compact glacial clay through 10 cm pebbles and cobbles of unknown size *Augered from 50 cmbs *Terminated due to inhibitive cobbles*	No recovery
32	110	0–5: 10YR 2/2; wet clumpy sandy loam with 5% 3–5 cm rounded gravel; clear basal contact 5–80: 10YR 5/4; loose sandy loam with 10% 3–7 cm rounded gravel; clear basal transition 80–110: 10YR 6/3; compact clayey loam with 5% 3–5 cm rounded gravel *Augered from 100 cmbs *Terminated at depth in standing water*	No recovery
33	62	0–51: 7.5YR 4/2; loam with up to 15 cm cobbles and many roots; clear basal contact 51–62: 2.5Y 6/3; compact glacial clay through 8 cm gravel and cobbles of unknown size *Augered from 48 cmbs *Terminated due to inhibitive cobbles*	No recovery
34	70	0–60: 10YR 2/2; loose to compact sandy loam with 5% 3–5 cm rounded gravel and large roots; clear basal contact 60–70: 10YR 5/3; compact glacial sediments with 15% 3–12 cm rounded to subangular cobbles *Terminated due to inhibitive cobbles and roots*	No recovery
35	62	0–10: 7.5YR 3/1; humic layer; gradual basal transition 10–52: 7.5YR 3/2; organics–rich, slightly sandy loam with < 10% gravel and pebbles and thick roots; clear basal contact 52–62: 7.5YR 4/4; sandy loam with < 10% rounded gravel and thick tree roots *Augered from 45 cmbs *Terminated due to inhibitive tree roots*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
36	90	0–12: 10YR 2/2; loose sandy loam with 5% 3–5 cm rounded gravel; clear basal contact 12–30: 10YR 4/6; compact sandy loam with 10% 3–5 cm rounded gravel; gradual basal transition 30–90: 10YR 5/3; compact coarse sand with 15% 5–10 cm rounded gravel *Terminated due to inhibitive cobbles*	No recovery
37	74	0–15: 7.5YR 3/2; loam and roots; messy basal contact 15–55: 7.5YR 4/4; sandy loam with up to 15 cm rounded cobbles; clear basal contact 55–74: 2.5Y 6/3; compact glacial clay through 15 cm rounded cobbles *Augered from 57 cmbs *Terminated due to inhibitive cobbles in glacial sediment*	No recovery
38	85	0–57: 10YR 2/2; loose, very cobbly sandy loam with 15% 3–5 cm rounded gravel and 10–15+ cm rounded pebbles; clear basal contact 57–85: 10YR 5/3; wet clayey loam with 15% 5–10 cm rounded gravel *Terminated due to auger refusal below groundwater*	No recovery
39	42	0–14: Gray gravelly sandy loam with rounded clasts up to 6 cm in diameter, likely weathered glacial deposits; gradual basal transition 14–42: 2.5Y 6/2; somewhat compact but mostly loose and nonplastic very fine sand through 15 cm rounded cobbles, likely glacial outwash *Terminated at depth in glacial sediment*	No recovery
40	75	0–38: 10YR 2/2; loose clayey loam with 10% 3–5 cm rounded gravel; clear basal contact 38–50: 10YR 6/3 to 10YR 5/3, shading with depth; moderately compact sandy loam with 10% 3–10 cm rounded gravel; gradual basal transition 50–75: 10YR 5/3; compact sandy loam with 15% 3–10 cm rounded gravel *Terminated due to auger refusal*	No recovery
41	24	0–20: 7.5YR 3/2; loam, groundwater seepage below 5 cmbs; fill to 25+ cmbs; clear basal contact 20–24: Wet light brown silt through rounded cobbles of unknown size, probably glacial; attempted auger from 22 cmbs, lack of retrieval *Terminated due to sidewall collapse and lack of retrieval in standing water*	No recovery
42	25	0–25: 10YR 5/2; 70% 1–3 cm and 5–10 cm angular to rounded gravel fill with a coarse sand matrix; froundwater seepage; fill to 42 cmbs *Terminated due to inhibitive cobbles in standing water*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
43	53	0–5: 7.5YR 3/1; gravelly loam; gradual basal transition 5–42: 2.5Y 6/2; compact gravel fill with asphalt chunks up to 23 cmbs; clear basal contact 42–53: 7.5YR 4/4; sandy loam and wood fragments with sparse rounded gravel; attempted auger from 52 cmbs *Terminated due to refusal on large cobble*	No recovery
44	40	0–30: 10YR 5/1; compact 70% 3–10 cm angular gravel fill with a coarse sand matrix; fill and concrete to 40+ cmbs; groundwater seepage; clear basal contact 30–40: 10YR 3/1; very compact sandy loam with 30% 3–7 cm rounded gravel *Terminated at concrete blockage in standing water*	No recovery
45	25	0–25: 2.5Y 6/2; compact gravel fill, groundwater seepage below 20 cmbs; fill to 25+ cmbs *Terminated due to compact gravel and standing water*	No recovery
46	30	0–10: 10YR 5/1; compact 70% 3–10 cm angular gravel fill with a coarse sand matrix; fill to 30+ cmbs; clear basal contact 10–30: Black, very compact 3–5 cm angular gravel fill with a coarse sand matrix *Terminated due to inhibitive fill density*	No recovery
47	80	0–30: 10YR 5/1; compact 70% 3–10 cm angular gravel fill with a coarse sand matrix; fill to 30 cmbs; clear basal contact 30–70: 10YR 3/1; compact sandy loam with 10% 3–5 cm rounded gravel; clear basal contact 70–80: 10YR 5/3; compact sandy glacial sediments with 15% 3–10 cm angular to rounded gravel *Terminated due to inhibitive cobbles in glacial sediment*	No recovery
48	30	0–10: 10YR 2/2; loose wet clayey loam with 3% gravel; clear basal contact 10–30: 10YR 5/3; very compact wet glacial sediments with 15% rounded to angular gravel *Terminated at depth in glacial sediment*	No recovery
49	36	0–15: 7.5YR 4/4; loam and grass roots; imported topsoil to 15 cmbs; clear basal contact 15–36: 2.5Y 7/4; compact glacial clay to 14 cm rounded cobbles *Terminated at depth in glacial sediment*	No recovery
50	45	0–25: 10YR 2/2; loose wet clayey loam with 3% gravel; clear basal contact 25–45: 10YR 5/4; very compact glacial sediments with 15% rounded to angular gravel; groundwater seepage *Terminated at depth in glacial sediment*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
51	33	0–27: 7.5YR 4/4; wet loam and grass roots; imported topsoil to 27 cmbs; clear basal contact 27–33: 2.5Y 7/4; compact glacial clay through 10 cm cobbles, groundwater seepage below 28 cmbs *Terminated due to inhibitive cobbles in glacial sediment*	No recovery
52	40	0–20: 10YR 2/2; loose wet clayey loam with 3% 3–5 cm rounded gravel; clear basal contact 20–40: 10YR 5/4; very compact sandy glacial sediments with 15% 3–7 cm rounded to angular gravel *Terminated at depth in glacial and standing water*	No recovery
53	39	0–27: Brown loam and grass roots with rounded cobbles up to 14 cm; imported topsoil to 27 cmbs; clear basal contact 27–39: 2.5Y 7/4; compact glacial clay to 20 cm rounded cobbles with slow groundwater seepage *Terminated due to inhibitive cobbles in glacial sediment*	No recovery
54	60	0–15: 10YR 2/2; very loose sandy loam with 3% 3–7 cm rounded gravel; clear basal contact 15–20: 10YR 5/3; very loose fine sand; clear basal contact 20–60: 10YR 2/2; very loose sandy loam with 5% 3–5 cm rounded gravel *Terminated due to inhibitive boulder*	No recovery
55	100	0–90: 10YR 3/2; loose fine sand; clear basal contact 90–100: 10YR 5/3; very compact sandy glacial sediments with 15% 3–10 cm rounded gravel. *Augered from 90 cmbs *Terminated due to auger refusal in glacial sediment*	No recovery
56	42	0–12: Subangular clean gravel fill; fill to 42 cmbs; clear basal contact 12–42: 10YR 4/2; sandy loam fill with rounded gravel and cobbles up to 20 cm *Terminated due to inhibitive tree roots*	No recovery
57	60	0–60: 7.5YR 5/1, 7.5YR 6/1; compact sand and gravel fill with < 20 cm subangular to rounded cobbles and asphalt chunks; contains pockets of mostly clean medium to coarse sand; moderate groundwater seepage up to 50 cmbs; fill to 60+ cmbs *Terminated due to inhibitive cobble and standing water*	No recovery
58	80	0–20: 10YR 3/2; sandy loam with 5% 3–5 cm rounded gravel; clear basal contact 20–40: 10YR 5/2; very compact coarse sandy loam with 18% 3–10 cm subrounded to subangular gravel; clear basal contact 40–80: 10YR 5/4; clayey loam with 5% 3–5 cm rounded gravel; groundwater seepage below 40 cmbs *Terminated due to sidewall collapse and infill*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
59	50	0–20: 10YR 2/2; loose humic layer with 5–10% 3–5 cm subrounded gravel and abundant roots; clear basal contact 20–50: 10YR 5/4; very wet loose loam with 5% 1–3 cm rounded gravel and 5% 5–10 cm rounded pebbles *Terminated due to sidewall collapse and infill*	No recovery
60	26	0–26: 7.5YR 4/3; loose brown gravelly loam and roots with rounded cobbles up to 18 cm in diameter; groundwater saturation and rapid seepage below 22 cmbs leading to sidewall collapse *Terminated due to sidewall collapse and infill*	No recovery
61	30	0–30: 7.5YR 4/3; loose brown gravelly loam and tree roots with rounded pebbles up to 12 cm diameter; groundwater saturation and rapid seepage below 24 cmbs leading to sidewall collapse; small oil slicks on pooled groundwater *Terminated due to sidewall collapse and infill*	No recovery
62	73	0–22: 5YR 3/2; brown loam with abundant rounded gravel and cobbles up to 18 cm in diameter; clear basal contact 22–73: 5Y 6/3; beige clayey silt with minor sand; fine sediments are fairly clean near the top with < 15% rounded 1 cm gravel increasing to > 25% rounded 16 cm cobbles; soil is highly plastic when wet, contains minimal iron staining next to some clasts; very slow groundwater seepage up to 72 cmbs *Terminated due to inhibitive cobbles*	No recovery
63	50	0–50: 10YR 5/3; compact coarse sandy loam with 15% 3–5 cm rounded gravel and 10–12 cm rounded cobbles *Terminated due to inhibitive cobbles*	No recovery
64	85	0–35: 10YR 2/2; clumpy loose wet loam with 10% rounded 3–5 cm gravel; clear basal contact 35–85: 10YR 5/4; compact wet sandy loam with 15% rounded 3–10 cm gravel *Augered from 14 cmbs *Terminated due to refusal*	No recovery
65	57	0–20: 10YR 3/4; loam with small subrounded gravel; clear basal contact 20–30: 10YR 5/6; clayey loam with gravel and small pebbles; gradual basal transition 30–57: 10YR 4/6; silty sand with abundant subrounded gravel and pebbles *Terminated at depth in glacial sediments*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
66	70	0–20: 10YR 2/2; loose wet loam with 10% angular 3–5 cm gravel; fill; clear basal contact 20–50: 10YR 5/2; compact coarse sandy loam with 10% rounded to angular 3–10 cm gravel; mixed fill and disturbed glacial; clear basal contact 50–70: 10YR 5/3; compact coarse sandy loam with 15% subrounded to subangular 3–10 cm gravel *Augered from 50 cmbs *Water table at 50 cmbs *Terminated due to refusal in glacial sediment*	No recovery
67	45	0–25: 10YR 3/4; loam with small subrounded gravel; clear basal contact 25–45: 10YR 4/6; silty sands with abundant subrounded to angular pebbles and cobbles *Terminated at depth in glacial sediment*	No recovery
68	110	0–110: 10YR 6/1; coarse sand with 20% rounded 1–7 cm gravel *Terminated due to refusal*	No recovery
69	30	0–10: 10YR 3/4; loam with small subrounded gravel; clear basal contact 10–30: 10YR 4/6; saturated silty sands with subrounded gravel and cobbles *Terminated at depth in glacial sediment*	No recovery
70	60	0–30: 10YR 2/2; sandy loam with 10% rounded 3–8 cm gravel; clear basal contact 30–60: 10YR 4/3; clayey loam with > 3% rounded 1–3 cm gravel and groundwater *Terminated due to refusal*	No recovery
71	50	0–20: 10YR 3/4; loam with small subrounded gravel; gradual basal transition 20–30: 10YR 4/6; loam with no gravel; gradual basal transition 30–50: 10YR 4/6; silty sands with subrounded gravel and cobbles *Terminated at depth in glacial sediment*	No recovery
72	80	0–10: 10YR 2/2; loose humic loam with 5% rounded 3–5 cm gravel; clear basal contact 10–55: 10YR 4/3; compact medium to fine sand with 10% rounded 3–5 cm gravel; clear basal contact 55–80: 10YR 5/3; silty loam with 15% subangular 5–7 cm gravel *Augered from 55 cmbs *Terminated due to refusal in glacial sediment*	No recovery
73	35	0–20: 10YR 3/4; loam with small subrounded gravel; clear basal contact 20–35: 10YR 4/6; silty sands with subrounded gravel and cobbles *Terminated at depth in glacial sediment*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
74	35	0–5: 10YR 3/4; loam with small subrounded gravel; clear basal contact 5–35: 10YR 4/6; silty sands with subrounded gravel and cobbles *Terminated at depth in glacial sediment*	No recovery
75	60	0–10: 10YR 2/2; humic loam with 5% rounded 3–5 cm gravel; clear basal contact 10–50: 10YR 5/3; compact sandy loam with 10% subangular to rounded 3–10 cm gravel 50–60: 10YR 2/4; sandy loam with 5% rounded gravel and roots *Terminated due to refusal on roots*	No recovery
76	75	0–1.3: 10YR 2/2; humic loam with 5–10% rounded 3–8 cm gravel; clear basal contact 1.3–50: 10YR 5/3; silty sandy loam with 15% subangular to rounded 5–7 cm gravel; gradual basal transition 50–75: 10YR 5/3; silty loam with > 3% rounded gravel *Augered from 50 cmbs *Terminated at depth in glacial with auger refusal*	No recovery
77	40	0–20: 10YR 3/4; loam with small subrounded gravel and many small roots; gradual basal transition 20–40: 10YR 4/6; clay through sand with subrounded pebbles and cobbles and many roots *Terminated at depth in glacial, on inhibitive root*	No recovery
78	80	0–40: 10YR 3/2; slightly sticky gravelly sandy loam with common rounded to subrounded pebbles and small cobbles; gradual basal transition 40–50: 10YR 4/4; fravelly sandy loam with common rounded to subrounded pebbles and small cobbles 50–70: 5YR 4/4; saturated, possibly burnt sandy silt with abundant subrounded to subangular pebbles 70–80: 2.5Y 6/2; silty sand outwash with abundant subrounded to subangular pebbles *Augered from 65 cmbs *Terminated due to hole collapse from groundwater*	No recovery
79	30	0–10: 10YR2/2; loose sandy loam with 5% rounded 3–5 cm gravel; clear basal contact 10–30: 10YR 5/3; very compact coarse sandy loam with 15% subrounded 5–10 cm gravel *Terminated due to refusal at depth in glacial sediment*	No recovery
80	40	0-10 10YR 3/4; Silt loam with no gravels; gradual boundary 10–20: 10YR 4/6; Silty sandy loam with some subrounded pebbles; abrupt boundary 20–40: 10YR 6/3; sandy claayey loam with abundant subrounded to angular gravel and cobbles *Terminated at depth in glacial sediment*	No recovery
81	45	0–45: 10YR 2/2; wet sandy loam with 5% rounded 3–5 cm gravel. *Terminated in groundwater*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
82	30	0–3: 10YR 3/4; loam; gradual basal transition 3–13: 10YR 4/6; sandy loam; clear basal contact 13–30: 10YR 6/3; sandy clayey loam with abundant subrounded to angular gravel and cobbles; groundwater at 25 cmbs *Terminated in groundwater within glacial sediment*	No recovery
83	40	0–10: 10YR 2/2; loose sandy loam with 5% rounded 3–5 cm gravel; clear basal contact 10–40: 10YR 2/2; wet sandy loam and coarse sands with 5% rounded gravel and 5% wood chips; standing water at 10 cmbs; fill *Terminated in groundwater*	No recovery
84	60	0–5: 10YR 2/2; loose sandy loam with 5% rounded 3–5 cm gravel; clear basal contact 5–15: 10YR 5/2; compact sandy loam with 15% subrounded gravel; disturbed glacial; clear basal contact 15–50: 10YR 2/2; loose sandy loam with 5% rounded gravel and 5% woodchips; fill; clear basal contact 50–60: 10YR 5/2; very compact sandy loam with 15% subrounded 5–10 cm gravel *Terminated due to refusal in glacial sediment*	No recovery
85	30	0–30: 10YR 3/4; saturated, slightly compact sandy loam with some subrounded gravels and cobbles; standing groundwater near 30 cmbs *Terminated in groundwater with sidewall collapse*	No recovery
86	40	0–25: 10YR 3/4; sandy loam with no gravel; gradual basal transition 25–35: 10YR 4/6; sandy, clayey loam with small subrounded gravel; gradual basal transition 35–40: 10YR 6/3; compact sandy, clayey glacial loam with subrounded gravel to large cobbles *Terminated due to refusal in glacial sediment*	No recovery
87	80	0–80: 10YR 2/2; normally graded sandy loam with 5–15% rounded 3–7 cm gravel; water at 20 cmbs *Terminated due to refusal in groundwater*	No recovery
88	50	0–10: 10YR 2/2; sandy loam with 10% rounded 3–5 cm gravel; clear basal contact 10–50: 10YR 5/2; compact, wet coarse sandy loam with 15% subrounded 3–7 cm gravel *Terminated at depth in glacial sediment with standing water*	No recovery
89	60	0–30: 10YR 3/4; loam with some subrounded gravel and cobbles; clear basal contact 30–32: 10YR 4/6; pocket of clayey loam with no gravel; clear basal contact 32–60: 10YR 3/4; loam with some subrounded gravel and cobbles; groundwater near 60 cmbs *Terminated in groundwater with sidewall collapse*	No recovery
90	40	0–40: 10YR 3/4; loam with subrounded gravel and cobbles; groundwater near 40 cmbs *Terminated in groundwater with sidewall collapse*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
91	30	0–30: 10YR 3/4; sandy loam with subrounded gravel and cobbles; groundwater at 30 cmbs *Terminated in groundwater with sidewall collapse*	No recovery
92	50	0–50: 10YR 3/4; sandy loam with some subrounded gravel and cobbles; groundwater at 50 cmbs *Terminated in groundwater with sidewall collapse*	No recovery
93	40	0–5: 10YR 3/4; loam with no gravel; clear basal contact 5–7: 10YR 3/1; charcoally brown loam with abundant small, subrounded gravel; no significant charcoal fragments; clear basal contact 7–40: 10YR 4/6; clayey glacial loam with subrounded gravels and small cobbles *Terminated at depth in glacial sediment*	No recovery
94	40	0–5: 10YR 3/4; loam, no gravel; gradual basal transition 5–40: 10YR 4/6; silty clay loam with small subrounded gravel and some cobbles, many moderately thick roots *Terminated due to refusal on roots*	No recovery
95	33	0–33: Mottled 10YR 5/2 and 2.5Y 6/1; silty sand construction fill, likely cut glacial material from elsewhere on the property; abundant rounded to subrounded pebbles and small cobbles; groundwater at 30 cmbs *Terminated due to inhibitive cobbles in fill*	No recovery
96	80	0–60: 10YR 4/3; loose sandy loam with 5% rounded 3–5 cm gravel; gradual basal transition 60–70: 10YR 4/2; loose sandy loam with 5% rounded 3–5 cm gravel; clear basal contact 70–80: 10YR 4/2; very wet loose sandy loam with 5% rounded 3–5 cm gravel and 5% wood chips; water at 70 cmbs *Terminated in groundwater*	No recovery
97	66	0–66: 10YR 5/2; coarse sand with 20% unsorted rounded to subangular 3–10 cm gravel and 5% rounded 12–15 cm cobbles; fill/disturbed *Terminated due to inhibitive cobbles in fill*	No recovery
98	50	0–20: 10YR 2/2; loose but clumpy sandy loam with many rootlets and 5% rounded 3–5 cm gravel; clear basal contact 20–50: 10YR 4/3; loose, nonplastic sandy loam with large roots and 5% rounded 3–5 cm gravel *Terminated due to inhibitive root*	No recovery
99	83	0–83: Mottled 10YR 5/2 and 2.5Y 6/1; silty sand construction fill, likely cut glacial material from elsewhere on the property; abundant rounded to subrounded pebbles and small cobbles; groundwater at 50 cmbs *Terminated due to inhibitive cobbles in fill*	No recovery
100	50	0–15: 10YR 5/2; sandy silt with abundant rounded to subrounded pebbles and small cobbles; gradual basal transition 15–50: 2.5Y 6/1; very compact silty sand outwash with abundant rounded to subrounded pebbles and small cobbles; groundwater to 25 cmbs *Terminated at inhibitive cobbles at depth in glacial sediment*	0–10 cmbs: Temporally non-diagnostic flat, colorless glass fragment (n=1)

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
101	30	0–30: 10YR 2/2; loose wet coarse sandy loam with 15% rounded 3–10 cm gravel; standing water at 5 cmbs *Terminated in standing water*	No recovery
102	50	0–50: 10YR 2/2 and 2/1; saturated sandy loam with 10% rounded 3–10 cm gravel, 10% wood detritus, > 3% charcoal; standing water by 15 cmbs *Terminated in standing water*	No recovery
103	80	0–15: 10YR 3/2; humic silty sand with common rounded to subrounded pebbles and many salal roots; gradual basal transition 15–55: 10YR 5/4; sandy silt with common to abundant rounded to subrounded pebbles and cobbles; gradual basal transition 55–80: 2.5Y 6/2; sandy silt outwash with abundant rounded to subrounded pebbles and cobbles *Terminated at depth in glacial sediment*	No recovery
104	60	0–10: 10YR 2/2; humic loam with 5% rounded 3–5 cm gravel and roots; clear basal contact 10–60: 10YR 5/4; loose cobbly coarse sandy loam with 15% rounded 5–10 cm gravel *Terminated due to refusal on cobbles*	No recovery
105	70	0–20: 10YR 2/2; sandy loam with 10% rounded 3–5 cm gravel and many roots; clear basal contact 20–70: 10YR 5/4; loose very cobbly coarse sandy loam with 15% rounded 3–5 cm gravel, 7+ cm cobbles, one 40 cm boulder from 30 to 70 cm depth *Terminated due to refusal on cobbles*	No recovery
106	80	0–10: 10YR 2/2; loose humic sandy loam with 5% rounded 3–5 cm gravel; clear basal contact 10–80: 10YR 3/6 to 4/3 with depth; nonplastic sandy loam with 10% subrounded 3–7 cm gravel *Terminated due to refusal on rocks*	No recovery
107	75	0–15: 10YR 2/2; loose somewhat plastic humic loam with 5% rounded 3–5 cm gravel and roots; clear basal contact 15–60: 10YR 3/3; loose somewhat plastic loam with 10% subrounded 3–7 cm gravel; clear basal contact 60–75: 10YR 5/3; loose wet somewhat plastic loam; water at 60 cmbs *Terminated in standing water*	No recovery
108	70	0–15: 10YR 2/2; somewhat plastic humic loam with 5% rounded gravel; clear basal contact 15–50: 10YR 4/2; nonplastic sandy loam with 5% subrounded gravel; clear basal contact 50–70: 10YR 3/2; somewhat plastic sandy loam with 5% subrounded gravel *Terminated in standing water*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
109	70	0–10: 10YR 2/2; somewhat plastic humic loam with 5% rounded gravel; clear basal contact 10–70: 10YR 4/2 to 3/2 with depth; nonplastic sandy loam with 5% subrounded gravel; water at 60 cmbs *Terminated in standing water*	No recovery
110	67	0–23: 10YR 3/4; silty sand with some rounded to subangular pebbles and many rootlets; gradual basal transition 23–45: 10YR 5/4; sandy silt with common rounded to subangular pebbles and small cobbles; clear basal contact 45–67: 2.5Y 6/2; moderately sticky sandy silt outwash with common subrounded to subangular pebles and cobbles *Terminated at depth in glacial sediment*	No recovery
111	51	0–15: 10YR 3/4; compact silty sand with some rounded to subangular pebbles; gradual basal transition 15–30: 10YR 5/4; compact, slightly sticky sandy silt with some rounded to subangular pebbles; clear basal contact 30–51: 2.5Y 6/2; moderately sticky sandy silt outwash with moderate to abundant rounded to subangular pebbles *Terminated at depth in glacial sediment*	0–10 cm: Temporally non-diagnostic fragment of colorless, flat glass
112	21	0–10: 10YR 3/4; humus-mantled loam with no gravel; gradual basal transition 10–21: 10YR 4/6; clayey loam with abundant subrounded gravel and cobbles, roots *Terminated due to inhibitive root*	No recovery
113	75	0–25: 10YR 2/2; loose humic sandy loam with 5% rounded 3–5 cm gravel; clear basal contact 25–60: 10YR 5/1; loose sandy loam with 10% subrounded to subangular 3–7 cm gravel; patches of 10YR 6/4, possibly cedar roots; clear basal contact 60–75: 10YR 5/2; very compact sandy loam with 15% subrounded 5–10 cm gravel *Terminated due to refusal on cobbles*	No recovery
114	60	0–10: 10YR 3/4; humus-mantled loam with no gravel; gradual basal transition 10–60: 10YR 4/6; clayey loam with abundant subrounded gravel and cobbles *Terminated at depth in glacial sediment*	No recovery
115	70	0–20: 10YR 2/2; loose humic sandy loam with 7% rounded 3–7 cm gravel 20–40: 10YR 5/1; moderately compact sandy loam with 10% subrounded 3–10 cm gravel 40–70: 10YR 5/3; very compact sandy loam with 15% subrounded 3–10 cm gravel *Terminated at depth in glacial sediment*	No recovery

OMF South: ATCRC Shovel Probe Log – OMF South / TDLE Overlap Area, January 2021 (continued)

Shovel Probe	Maximum Depth (cmbs)	Description (cmbs): Description—Comments	Cultural Materials
116	60	0–5: 10YR 3/4; humus-mantled loam with no gravel; gradual basal transition 5–60: 10YR 4/6; clayey loam with some subrounded gravel, sparse subrounded cobbles, and a tree root *Terminated due to inhibitive root at depth in glacial*	No recovery
117	85	0–10: 10YR 2/2; loose humic sandy loam with 5% rounded 3–5 cm gravel; clear basal contact 10–85: 10YR 6/2; somewhat plastic sandy loam with 7% subangular 3–7 cm gravel *Terminated in groundwater*	No recovery
118	95	0–25: 10YR 3/2; loose sandy loam with 15% rounded 1–3 cm gravel; clear basal contact 25–95: 10YR 6/3; clayey loam with 10% subangular to angular 3–7 cm gravel *Terminated due to refusal on cobbles, in groundwater*	No recovery
119	57	0–10: 10YR 3/4; humus-mantled loam with no gravel; gradual basal transition 10–57: 10YR 5/6; saturated clayey loam with abundant subrounded gravel and some small subrounded cobbles *Terminated at depth in glacial sediment*	No recovery
120	32	0–2: 10YR 3/4; loam with no gravel, tree debris on top; clear basal contact 2–32: 10YR 5/6; wet clayey loam with some subrounded gravel and small cobbles *Terminated due to inhibitive root at depth in glacial sediment*	No recovery
121	70	0–10: 10YR 2/2; humic sandy loam with 5% rounded 3–5 cm gravel; clear basal contact 10–55: 10YR 4/3; Loose silty loam with 5% rounded 1–3 cm gravel and > 3% rootburn charcoal; clear basal contact 55–70: 10YR 5/3; very compact sandy loam with 10% subrounded 5–7 cm gravel *Terminated due to refusal in glacial*	No recovery
122	57	0–5: 10YR 3/4; humus-mantled loam with no gravel; gradual basal transition 5–10: 10YR 5/6; wet clayey loam with some subrounded gravel and small cobbles 10–57: 10YR 4/6; clayey loam with some small subrounded gravel and tree roots *Terminated due to inhibitive root at depth in glacial sediment*	No recovery
123	90	0–2: 10YR 2/2; humic sandy loam with 5% rounded 3–5 cm gravel; clear basal contact 2–30: 10YR 5/3; compact sandy loam with 15% rounded 3–7 cm gravel; disturbed glacial; clear basal contact 30–55: 10YR 6/1; loose sandy loam with 20% rounded 3–10 cm gravel; disturbed; clear basal contact 55–90: 10YR 4/2; compact, wet clayey loam with 5% rounded 3–10 cm gravel *Terminated in groundwater*	No recovery

Archaeological Site Forms

STATE OF WASHINGTON
ARCHAEOLOGICAL SITE INVENTORY FORM

Smithsonian Number: 45KI1542

County: King

Date: 8/14/2020 **Human Remains?** ☐ **DAHP Case No.:**

Compiled By: Edgar Huber Aqua Terra Cultural Resource Consultants

Archaeological Sites are exempt from public disclosure per RCW 42.56.300

SITE DESIGNATION

Site Name:	Historic Period Concrete Foundation
Field/Temporary ID:	Historic Period Concrete Foundation (ATCRC-2020-01)
Site Type:	Historic Agriculture
	Historic Structures Not Specified

As the designated authority under the National Historic Preservation Act, as amended, I hereby certify that this request for determination of eligibility meet the documentation standards for registering properties in the National Register of Historic Places and meets the procedural and professional requirements set forth in 36 CFR Part 60. In my opinion, the site

☐ meets ☑ does not meet the National Register Criteria.

I recommend that this property be considered significant at the following level(s) of significance:

Criteria

Statement of Significance

Located off of SR 99, the foundation is the remains of a barn associated with John Danielson, who owned the barn. It was constructed in 1932, at the beginning of the Great Depression (King County Structure Assessment Form). It appears that the barn's demolition occurred between 1940 and 1950. The former structure was likely a west-facing gable. The two-story building has a dirt and concrete floor. The foundation was associated with the important economic collapse of the 1930s and the agricultural development of the area from the 1920s through the early 1960s.
The site does not contribute to the broad patterns of local, state, or national history and is recommended as not eligible for listing in the NRHP under Criterion A. Although multiple individuals have owned the land where the site is located, the foundation is closely linked with ownership by John Danielson. Research has not demonstrated that the resource is associated with individuals who are significant in local, state, or national events and is recommended as not eligible for listing in the NRHP under Criterion B. The foundation is not considered significant in terms of engineering, architecture, or artistic distinction nor does it embody distinctive characteristics of a type, period, or method of construction. It is not the work of a master and is not eligible for listing in the NRHP under Criterion C. The foundation itself has minimal data content and is common to concrete construction methods of the 1930s. Subsurface investigations (shovel probes) around the foundation failed to identify any subsurface cultural materials or features associated with the site. The site lacks the potential to contribute significant information that might contribute to our understanding of rural farming and its social and economic context in this area of Washington in the 1930s. It is not eligible for listing in the NRHP under Criterion D.
In summary, site 45KI1542 lacks integrity and does not meet criteria to be considered significant under Criteria A through D of the NRHP and does not meet criteria necessary for listing in the WHR or local registers.

Integrity

The site's structural remnants are still in the original construction location, thereby retaining the integrity of geographic location. However, due to the removal and demolition of the building's superstructure, the resource lacks integrity of design. The setting, feeling, and association no longer retain integrity as the setting has been substantially altered from its period use. The original rural landscape setting is now heavily urbanized, thereby removing all aspects of the structure's former setting. The associated pasture, once and integral portion of the structure's setting and feeling has been substantially altered and its current use is as a wooded water catchment basin. In sum, the site no longer retains significance or integrity in the majority of its aspects.

SITE LOCATION

USGS Quad Map Name(s): POVERTY BAY

T:	21	**R:**	04	**E/W:**	E	**Section:**	21
UTM: Zone:	10	**Easting:**	552012	**Northing:**	5238619		
Latitude:	47.299	**Longitude:**	-122.312	**Elevation (ft/m):**			
Drainage, Major:	Puyallup	**Drainage, Minor:**	Hylebos Creek-Frontal Commencement Bay	**River Mile**			

Aspect east-northeast **Slope** 1 degree

Location Description (General to Specific):

The site is located in King County, Federal Way, north of Kitts Corner, off of the SR 99 entrance to the Christian Faith Center within King County Parcel No. 2121049026.

Directions (For Relocation Purposes):

From the corner of SR99 and 16th Ave South, proceed north for 210ft. Turn right onto the access road for the Christian Faith Center. Proceed for 100ft, turn left onto the access levee for the water catch basin, proceed for 30ft., turn right and proceed for another 30ft.

SITE DESCRIPTION

Narrative Description (Overall Site Observations)**:**

Site 45KI1542 is a historic-period concrete slab and perimeter wall foundation located within parcel OMF 152, immediately south of the waterline within the City of Federal Way Stormwater Pond No. 159 (Figure G4.6-18). The foundation is located at a slightly higher elevation than the average water level of the pond, which is regulated by a stormwater filtration system approximately 20 meters north of the foundation. At the time of this survey, the waterline was approximately1 meter east of the foundation (Figure G4.6-18). The vegetation surrounding and over the foundation consisted of dense thickets of nettles, Himalayan blackberry, salmonberry, partially collapsed and sprawling white oak, Douglas-fir, and Western hemlock Substantial modern debris, including biohazard materials, are regularly cleared from this area (Personal Communication, David Rafael, Facilities Engineer Christian Faith Center, June 10, 2020).

Before an additional subsurface survey was conducted near this foundation, historic aerial photographs were reviewed in detail for this area. The earliest aerial imagery of this location is from 1936 and illustrates a building in the location of the identified foundation at the southwestern corner of a prairie (King County Map Vault 1935, Figure G4.6-22). The structure is no longer visible in aerial photographs by 1957 (EarthExplorer 1957, Figure G4.6-22). The tax assessment records for this area were accessed through the Puget Sound Regional Archives, who hold the historic King County Tax Assessors Records. Of the seven structures listed for the historic tax parcel, one matched the general description and location of the identified foundation (King County Structure Assessment Form). The likely structure was a 30-foot by 60-foot two-story barn with a concrete foundation, dirt and concrete floors, and a 10-foot by 12-foot concrete single room basement. The barn was built in 1932 and likely demolished between 1940 and 1950, given that it was assessed in 1940 by King County and noted as “gone” during the 1950 assessment.

The concrete perimeter foundation is oriented east-west with a total length of61 feet, 6 inches (east-west), and a width of 30 feet, 6 inches (north-south). The foundation is a 6-inch footing with an inner lip that defines the outer perimeter of the foundation. The eastern section of the foundation has a 6-inch thick concrete pad that is 10 feet long by 30 feet, 6 inches wide (Figure G4.6-18). The northeastern corner of the foundation was originally a basement and measured 22 feet long by 8 feet, 4 inches wide (Figures G4.6-18). Two 8-inch square posts that would have supported a subfloor or interior wall were identified offset from the southern basement wall by 3 feet. These structural details match the general details of the potential structure identified during archival research (King County Property Assessment Form).

Site Dimensions (Overall Site Dimensions)**:**

Length:	61 ft	**Direction:**	east-west	**Width:**	30 ft 6 inches	**Direction:**	north-south

Method of Horizontal Measurement: measuring tape

Depth: surface-6 inches **Method of Vertical Measurement:** measuring tape

Vegetation (On Site)**:**

Local:	The vegetation surrounding and over the foundation consisted of dense thickets of nettles, Himalayan blackberry, salmonberry, partially collapsed and sprawling white oak, Douglas-fir, and Western hemlock.	**Regional:**	The site is located in the Puget Sound variant of the Western Hemlock Zone.

Landforms (On Site)**:**

Local:	The foundation is located on an upland section of a water catchment basin - wetland.	**Regional:**	The site is located on a glacial plateau north of the Puyallup River Valley.

Water Resources (Type):	West fork of Hylebos Creek.	**Distance:**	~ 1 meter east-northeast.	**Permanence:**	Year round

CULTURAL MATERIALS AND FEATURES

Narrative Description (Specific Inventory Details)**:**

The concrete perimeter foundation is oriented east-west with a total length of 61 feet, 6 inches (east-west), and a width of 30 feet, 6 inches (north-south). The foundation is a 6-inch footing with an inner lip that defines the outer perimeter of the foundation. The eastern section of the foundation has a 6-inch thick concrete pad that is 10 feet long by 30 feet, 6 inches wide (Figure G4.6-18). The northeastern corner of the foundation was originally a basement and measured 22 feet long by 8 feet, 4 inches wide (Figures G4.6-18). Two 8-inch square posts that would have supported a subfloor or interior wall were identified offset from the southern basement wall by 3 feet. These structural details match the general details of the potential structure identified during archival research (King County Property Assessment Form).

Method of Collection:

None.

Location of Artifacts (Temporary/Permanent)**:**

No cultural materials associated with the use of the 1932 structure were identified during pedestrian survey or in the subsurface shovel probe investigations.

STATE OF WASHINGTON
ARCHAEOLOGICAL SITE INVENTORY FORM

Smithsonian Number: 45KI1543

County: King

Date: 2/21/2020 **Human Remains?** ☐ **DAHP Case No.:**

Compiled By: Edgar Huber Aqua Terra Cultural Resource Consultants

Archaeological Sites are exempt from public disclosure per RCW 42.56.300

SITE DESIGNATION

Site Name: Historic Debris Scatter

Field/Temporary ID: Historic Debris Scatter, ATCRC-2020-02

Site Type: Historic Debris Scatter/Concentration

As the designated authority under the National Historic Preservation Act, as amended, I hereby certify that this request for determination of eligibility meet the documentation standards for registering properties in the National Register of Historic Places and meets the procedural and professional requirements set forth in 36 CFR Part 60. In my opinion, the site

☐ meets ☑ does not meet the National Register Criteria.

I recommend that this property be considered significant at the following level(s) of significance:

Criteria

Statement of Significance

The site and its historical artifacts appear to be structural remnants; however, they are in secondary depositional context and site materials deposited as fill. The site does not appear to be associated with events significant to local, state, or national history (Criterion A); nor is it associated with the lives of individuals significant in local, regional or national historic past (Criterion B); nor is it significant for its engineering or architectural qualities (Criterion C); and the site lacks the potential to contain significant scientific information (Criterion D).
In summary, site 45KI1543 lacks integrity and does not meet criteria to be considered significant under Criteria A-D of the NRHP, and does not meet criteria necessary for listing in the WHR or local registers.

Integrity

Although no definitive evidence for the origin of this deposit of historic-period artifacts was obtained, the characteristics and content of the sites artifact assemblage — predominately construction materials along with their evident fragmentation and disturbed context — indicates that the artifacts are in a secondary depositional context and incorporated in an imported fill matrix. All of the debris shows evidence of having been tumbled and worn. The lack of metals in the debris identified also suggests that a concerted effort was made to remove it before the debris was deposited in its current location. Lastly, the sharp clear boundaries between multiple soil strata is a typical indication of modern landscape modification strategies, where soils are layered and compacted with heavy machinery. The act of removing, sorting, and redepositing the historic debris from its place of origin has severed its link to a specific location and setting.

SITE LOCATION

USGS Quad Map Name(s): POVERTY BAY

T: 21 **R:** 04 **E/W:** E **Section:** 21

UTM: Zone: 10 **Easting:** 552363 **Northing:** 5238382

Latitude:	47.2968	**Longitude:**	-122.3074	**Elevation (ft/m):**	
Drainage, Major:	Puyallup	**Drainage, Minor:**	Hylebos Creek-Frontal Commencement Bay	**River Mile**	
Aspect	East	**Slope**	Varies across site		

Location Description (General to Specific):

King County, Federal Way, northwest corner of 20th Ave South and South 341st Place.

Directions (For Relocation Purposes):

From Kitts Corner at SR99 and 16th Ave South, proceed south for 100ft. Turn left onto South 341st Place, proceed east for 1,550ft. The landform on which the site is present is on the left.

SITE DESCRIPTION

Narrative Description (Overall Site Observations)**:**

Site 45KI1543 is a historic-period debris scatter in the southern portion of parcel OMF 151, on a highly modified landform situated on the northwest corner of 20th Ave South and South 341st Place intersection. The debris scatter was initially identified in two locations in the northwest and southeast corners of the landform (Figure G4.6-24). The site is located in both the South 336th Street and South 344th Street alternatives.

Before an additional subsurface survey was conducted on the landform, historic aerial photographs were reviewed in detail for this area. The earliest aerial imagery of this location dated to 1936/1937 and illustrates a landscape with partial forest regrowth with winding paths following a clear-cut event. The closest structure at this time was located approximately 200 meters southwest as part of a small farmstead off South 344th Street (Figure G4.6-25) (King County Map Vault 1936/1937). In the next available imagery from 1957, the site location is completely forested and the closest structures at that time are approximately 200 meters directly south (Figure G4.6-25) (EarthExplorer 1957). There does not seem to be any access to this site from the developed areas of South 344th Street. There is no visible change in the landscape immediately surrounding the site until the development of the eastern half of South 341st Place in the 1980s. These developments slowly progressed eastward along the roadway, beginning with the clearcutting of parcels adjacent to the road between 1985 to 1987, followed by progressive grading and construction that occurred from 1987 to the early 1990s. Aerial imagery from 1990 shows the landform completely graded, with few clusters of vegetation. The landscape seems to have been completely graded to glacial soils during this time (Figure G4.6-25) (Earth Explorer 1990).

By 2002, the site had largely become overgrown, with evidence of dumping in aerial imagery. The evidence of dumping becomes more widespread between 2002 and 2005 (Google Earth 2020). In 2005, the site was once again mostly cleared during the preparation for the construction of 20th Ave South and the Christian Faith Center. It is at this time that the roadway shown on the surveyed landform is constructed, and a large pile of boulders appeared in the center of the landform (Google Earth 2020).

The boulders were spread across the landform by 2007, as shown in satellite imagery (Google Earth 2020), likely in conjunction with vegetation clearance. The final visible landscape alteration occurred in the summer of 2016 when a vegetation-removal effort occurred across the western half of the landform (Google Earth 2020).

A very sparse scatter of historical and recent artifacts was observed on the surface during the pedestrian survey of the landform between the two concentrations identified during the subsurface investigations (Figure G4.6-24). However, surface visibility was approximately 2 percent, with vegetation across the landform consisting of thick grasses, a thicket of Himalayan blackberry, Douglas-fir, Western hemlock, and several non-native decorative species. The landform also has three steep slopes, boulder piles, extensive utility corridors, and a prepared gravel road, which limited excavation locations.

Twenty-eight shovel probes were excavated across the landform. Of these,24 were excavated across the northwestern quarter of the landform, and the remaining four were excavated in the southeastern corner. A total of17 shovel probes contained modern or temporally non-diagnostic demolition debris (Figure G4.6-24). The soils across the site were identified as layers of fill over intact glacially deposited patent material. Glacial till was typically identified at depths between 20 to 30 centimeters below the surface.

The origin of this debris scatter is unknown. There is no evidence of historic structures near the site from the 1930s through the 1980s that could have been the source. This implies that the debris may have been imported as fill, or the site was used for dumping, following the modern clearance of the site for development. No diagnostic marks were identified on any of the artifacts encountered during the survey of this site. All of the brick fragments identified are hard, evenly fired, and of very fine industrial standard clay. All of them have edges that range from sub-round to very angular, and most are less than five centimeters in size. The cut stone fragments are finished on one face. Some have a finished edge. None have perforations, and the unfinished edges are subangular to angular. All of the glass fragments are less than2 square centimeters in size and have subangular to angular edges.

Site Dimensions (Overall Site Dimensions)**:**

Length:	260 feet (80 meters)	**Direction:**	north-south	**Width:**	50 ft (15) meters)	**Direction:**	east-west

Method of Horizontal Measurement: GPS

Depth: 0-28 inches (0 - 70 centimeters) **Method of Vertical Measurement:** measuring tape

Vegetation (On Site)**:**

Local:	The vegetation across the site consisted of thick grasses, a thicket of Himalayan blackberry, Douglas-fir, Western hemlock, and several non-native decorative species.	**Regional:**	Puget Sound area, of the Western Hemlock Zone.

Landforms (On Site)**:**

Local:

Regional:

Water Resources (Type)**:** West Hylebos Creek **Distance:** 170 meters **Permanence:** Year round

CULTURAL MATERIALS AND FEATURES

Narrative Description (Specific Inventory Details)**:**

The artifacts identified include nondiagnostic clear, green, and brown glass fragments; leather scraps, plastics (both hard fragments and films), numerous, machine-made brick fragments, a ceramic tile fragment, culinary ware, ceramic fragments, and cut stone block fragments. Only two metal artifacts were identified: a wire nail and an unidentified metal. None of the artifacts were distinctive or bore any markings that might have provided temporally significant information. All of these artifact types are mixed in the same general soil strata (brown sandy loam with pebbles and cobbles). In most cases (14 of 17), the artifact-bearing layer was present immediately on top of intact, undisturbed glacially deposited parent material with sharp, clearly defined boundaries. The other three positive shovel probes had multiple strata of modern fill with various artifact concentrations. All identified strata had sharply defined boundaries and contained moderate to high levels of pebbles and cobbles.

Method of Collection:

No artifacts were collected.

Location of Artifacts (Temporary/Permanent)**:**

All artifacts were returned to the individual shovel probe locations.

STATE OF WASHINGTON
ARCHAEOLOGICAL SITE INVENTORY FORM

Smithsonian Number: 45KI01583

County: King

Date: 4/2/2021 **Human Remains?** ☐ **DAHP Case No.:**

Compiled By: Ron Adams Historical Research Associates, Inc.

Archaeological Sites are exempt from public disclosure per RCW 42.56.300

SITE DESIGNATION

Site Name:

Field/Temporary ID: HRA-2902.02-1

Site Type: Historic Isolate

As the designated authority under the National Historic Preservation Act, as amended, I hereby certify that this request for determination of eligibility meet the documentation standards for registering properties in the National Register of Historic Places and meets the procedural and professional requirements set forth in 36 CFR Part 60. In my opinion, the site ☐ meets ☑ does not meet the National Register Criteria.

I recommend that this property be considered significant at the following level(s) of significance:

Criteria

Statement of Significance

This isolated beer bottle has no demonstrable connection to a pattern of events to be considered significant under Criterion A nor is it associated with a prominent person that would make it significant under Criterion B. The isolate also lacks any features that would make it significant under Criterion C. This artifact, by itself, contributes no new information about local, regional or national history and is therefore not significant under Criterion D.
Sound Transit recommends that Isolate HRA-2902.02-1 is not eligible for listing in the NRHP or the WHR. Sufficient information has been gathered from the site to evaluate it under National Register Criteria A, B, C, and D.

Integrity

Isolate HRA-2902.02-1 appears to retain integrity of location and potentially retains integrity of setting, feeling, and association, given that the immediate surroundings of the isolate (WSDOT right-of-way adjacent to I-5) have likely changed little since the artifact was deposited. As the isolate is not associated with built structures or other features, integrity aspects of design, materials, and workmanship do not pertain to the evaluation of the site.

SHPO Determination

Eligibility Potentially Eligible **Determined On** 8/27/2021

Determined By

SHPO Comments

SITE LOCATION

USGS Quad Map Name(s): POVERTY BAY

T: 21 **R:** 04 **E/W:** E **Section:** 16

UTM: Zone: 10 **Easting:** 552665 **Northing:** 5238865

Latitude: 47.3012 **Longitude:** -122.3033 **Elevation (ft/m):** 115

River Mile N/A

Drainage, Major:	Puget Sound	**Drainage, Minor:**	Hylebos Creek- Frontal Commencement Bay
Aspect	West	**Slope**	5%

Location Description (General to Specific):

The isolate is located in the eastern part of the city of Federal Way, Washington near the western base of an fill embankment slope that extends towards I-5 located approximately eight meters to the east of the isolate.

Directions (For Relocation Purposes):

From the intersection of S 336th St and 24th Ave S in Federal Way, Washington proceed to the east into the Washington State Department of Transportation (WSDOT) Right-of-Way (ROW) . Walk along the embankment west of I-5 within the WSDOT ROW for approximately 215 meters to the south/southwest to the isolate location.

SITE DESCRIPTION

Narrative Description (Overall Site Observations)**:**

This isolate consists of a beer bottle identified on the surface with embossing indicating that it was manufactured by the Northwestern Glass Company in 1966 (Lockhart et al. 2017). The bottle was identified near the base of an embankment that extends upward to the east to Interstate 5, located approximately 20 m to the east of the bottle. Other modern cans and debris dating from between the mid-1970s to 1990s was found within approximately 10 m to the south of the bottle on and near the base of the same embankment. Six shovel probes and shovel probe/auger cores (SP-71, SP-74, SP-75, SP-76, SP-77, and SP-78), excavated in the immediate vicinity of the 1966 bottle, including four radial shovel probes excavated within five m of the bottle, and in the immediate vicinity of the other, nearby surface items contained no historically diagnostic or pre-contact artifacts. Because none of the other items found in the vicinity of the 1966 bottle were historically diagnostic, the bottle is being recorded as an archaeological isolate.

Site Dimensions (Overall Site Dimensions)**:**

Length:	1 m	**Direction:**	N-S	**Width:**	1 m	**Direction:**	E-W

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Database (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 2859 S 244th Street, Kent, is located in King County. According to the county assessor, the structure was built in 1948 and is a single family dwelling. The building has a single-family form.

Surveyor Opinion

Significance narrative:	Integrity From its period of construction (1948), 2859 S 244th Street retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered, and the surrounding construction of heavy commercial development. The building retains integrity of location. Evaluation The building at 2859 S 244th Street was constructed in 1948 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D). Historical Research Associates recommends 2859 S 244th Street does not retain integrity from its period of construction (1948) and is not eligible any criteria for listing in the National Register of Historic Places or Washington Heritage Register.
Physical description:	Built in 1948, the residential building at 2859 S 244th Street fronts north (King County Assessor 2020). The one-story, rectangular building sits on a poured-concrete foundation, is clad in stucco, and is topped by a telescoping side-gabled roof clad in asphalt roofing. Windows throughout were vinyl framed in altered fenestration. The building is surrounded by heavy commercial development.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1952), 2907 S 244th Street retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered, and the surrounding construction of heavy commercial development. The building retains integrity of location.

Evaluation

The residential building at 2907 S 244th Street was constructed in 1952 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building, as initially constructed, may have embodied the distinctive characteristics of the Ranch style; however, alterations to windows, siding, and other materials have rendered the building unable to convey significance as a representative example of its type (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates recommends 2907 S 244th Street does not retain integrity from its period of construction (1952) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1952, the residential building at 2907 S 244th Street fronts north (King County Assessor 2020). The one-story, rectangular building on daylight basement sits on a poured-concrete foundation, is clad in vinyl siding, and is topped by a hipped roof clad in asphalt roofing. Visible windows were vinyl framed in altered fenestration. The slightly off-center wood entry door is accessed via a two-step concrete stoop. An exterior brick chimney is located on the north facade toward the east, flanked by two picture windows. A second, smaller chimney is located on the ridgeline toward to the west.

Surveyor Opinion

Significance narrative:	Integrity From their period of construction (1974), the buildings at 24852 Pacific Highway S appear to retain poor integrity of materials, design, and workmanship, due to a loss of at least some historic-period windows. The buildings retain integrity of location, setting, feeling, and association. Evaluation Three similar buildings are located at 24852 Pacific Highway S and were known as Lock-Tight Storage at the time of survey. The buildings were constructed in 1974 and do not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resources with the lives of significant persons (Criterion B). The buildings do not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the buildings were built of common construction methods and well-known materials and are unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D). Historical Research Associates recommends 24852 Pacific Highway S does not retain integrity from its period of construction (1974) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.
Physical description:	Built in 1974, the three commercial buildings at 24852 Pacific Highway S are located to the rear of a newer building facing south toward Pacific Highway. They are only partially visible from the ROW (King County Assessor 2020). The one-story, rectangular buildings sit on unknown foundations, are clad in vertical metal siding, and are topped by shed and shallow gable roofs clad in metal roofing. While fenestration is mostly screened from view, except for some garage bays, the most visible building includes at least one faux-grid vinyl-framed window.

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Databas (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The building at 25036 Pacific Highway S, Kent, is located in King County. According to the county assessor, the structure was built in 1966 and is a professional building. Also according to the county assessor, the structure was remodeled in 1976. The 1-story building has a commercial form.

Surveyor Opinion

Significance narrative:

Integrity
From its period of construction (1966), 25036 Pacific Highway S appears to retain poor integrity of materials, design, workmanship, setting, location, feeling, and association.
Evaluation
The building at 25036 Pacific Highway S was constructed in 1966 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates recommends 25036 Pacific Highway S does not retain integrity from its period of construction (1966) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1966, the vacant building at 25036 Pacific Highway S fronts north (King County Assessor 2020). The one-story, rectangular building sits on an unknown foundation, is clad in T1-11 siding, and is topped by a shed roof. The building was minimally visible from the ROW and included at least some aluminum-framed windows.

Surveyor Opinion

Significance narrative: Integrity

From its period of construction (1958), 25205 29th Avenue S retains poor integrity of materials, design, and workmanship, due to a loss of all historic-period windows and some cladding, which have been either altered or covered. The building retains integrity of location, setting, feeling, and association.

Evaluation

The building at 25205 29th Avenue S was constructed in 1958 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates recommends 25205 29th Avenue S does not retain integrity from its period of construction (1958) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description: Built in 1958, the residential building at 25205 29th Avenue S fronts east (King County Assessor 2020). The one-story, rectangular building sits on a poured-concrete foundation and is clad in a combination of vertical bead-board, shingles, and horizontal-board siding. The building is topped by a side-gabled roof with a projecting front-gabled porch, clad in asphalt roofing. All visible windows are vinyl-framed in altered fenestration. An attached garage is located on the south side of the residence.

Surveyor Opinion

Significance narrative:	Integrity From its period of construction (1957), 2905 S 252nd Street retains poor integrity of materials, design, workmanship, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered, and the conversion of the garage to living space. The building retains integrity of location, setting, and feeling. Evaluation The commercial building at 2905 S 252nd Street was constructed in 1957 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D). Historical Research Associates recommends 2905 S 252nd Street does not retain integrity from its period of construction (1957) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.
Physical description:	Built in 1957, the residential building at 2905 S 252nd Street fronts north (King County Assessor 2020). The roughly rectangular one-story building sits on a poured-concrete foundation and is clad in horizontal board siding. The building is topped by a side-gabled roof with a projecting front-gabled porch clad in asphalt roofing. Windows throughout appear to be a combination of wood-, aluminum-, and vinyl-framed, some with storm windows. The original garage, located on the east side of the building, has been converted to living space and includes a pedestrian door.

Detail Information

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Database (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 2919 S 252nd Street, Kent, is located in King County. According to the county assessor, the structure was built in 1957 and is a single family dwelling. The building has a single-family form with an attached garage.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1957), 2919 S 252nd Street retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows and some cladding, which have been either altered or covered. The building retains integrity of location and setting.

Evaluation

The residential building at 2919 S 252nd Street was constructed in 1957 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates recommends 2919 S 252nd Street does not retain integrity from its period of construction (1957) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1957, the residential building at 2919 S 252nd Street fronts north (King County Assessor 2020). The one-story, rectangular building sits on a poured-concrete foundation and is clad in a combination of shingles, horizontal boards, and T1-11 siding. The building is topped by a cross-gabled roof clad in asphalt/composition roofing; on the facade, the north-facing gable is supported by three square posts. Windows throughout appear to be vinyl framed in altered fenestration.

Surveyor Opinion

Significance narrative:	Integrity From its period of construction (1959), 3018 S 253rd Street retains poor integrity of materials, design, and workmanship, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered. The building retains integrity of location, setting, feeling, and association. Evaluation The building at 3018 S 253rd Street was constructed in 1959 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D). Historical Research Associates recommends 3018 S 253rd Street does not retain integrity from its period of construction (1959) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.
Physical description:	Built in 1959, the residential building at 3018 S 253rd Street fronts southwest (King County Assessor 2020). The one-story, rectangular building sits on a poured-concrete foundation, is clad in horizontal clapboard siding, and is topped by a side-gabled roof clad in asphalt roofing. An attached garage is located on the northwest side, and a central projecting gable porch covers the entry door. All windows are vinyl framed in altered fenestration.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1975), 1706 S Commons retains moderate integrity of materials, design, and workmanship. It is assumed that the mall has housed numerous commercial retailers, many of which have standardized storefronts utilized nationwide. When such retailers come and go, minor changes to cladding, massing, and window and doors are expected. They lead to moderate changes in integrity. The building retains integrity of location, setting, feeling, and association.

Evaluation

The commercial building at 1706 S Commons, originally known as SeaTac Mall, was constructed in 1975 kitty-corner from Federal Way's first mall, which was built in 1955 (Stein 2003). Though the building attracted 20,000 enthusiastic visitors to its grand opening, the subject commercial strip mall does not appear, based on a review of historic maps and local histories, to have any specific or direct association with events that made a significant contribution to the broad patterns of local, state, or national history, aside from continued commercial growth along Federal Way. Were it the first mall in the region, it may be significant for its associations with commerce. However, the mall appears to be more appropriately understood as an addition to an existing shopping center at its time of construction (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates recommends 1706 S Commons is not eligible for listing in the National Register of Historic Places or Washington Heritage Register under any criteria.

Physical description:

Built in 1975, the commercial building at 1706 S Commons fronts north (King County Assessor 2020). The irregular one-story building sits on a poured-concrete foundation, is clad in a combination of stucco siding and brick veneer, and is topped by a flat roof with parapet. At the time of survey the strip mall housed numerous big-box retailers, including a Target, Century Theatres, Kohl’s, and Macy’s. An associated retention pond is located south of the parking area with visible culverts.

Detail Information

Surveyor Opinion

Significance narrative: The Commons at Federal Way (formerly SeaTac Mall) is a regional shopping mall located in Federal Way and is the only indoor shopping center in the city. The previous owners, Steadfast Commercial Properties, changed the name to The Commons at Federal Way. The original developer was Harry Newman of Newman Properties. SeaTac Mall opened in 1975 on a forested, swampy pasture that was the homestead of Mabel Webb Alexander, who arrived in Washington in 1879 and died at age 96. For many years the original SeaTac Mall used a thunderbird in the logo and had a mascot, Thudius T. Thunderbird.

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Database (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The building at 2101 S 324th Street, Federal Way, is located in King County. According to the county assessor, the structure was built in 1966 and is a clubhouse. Also according to the county assessor, the structure was remodeled in 1974. The 1-story building has an other form.

Surveyor Opinion

Property appears to meet criteria for the National Register of Historic Places:	No
Property is located in a potential historic district (National and/or local):	No
Property potentially contributes to a historic district (National and/or local):	No

Significance narrative: Construction of the original Highway 1 in the state of Washington commenced in 1913. By October 1923, 700 miles of a two-lane highway had been completed connecting Vancouver, British Columbia, to the Oregon-California border. Just after the highway was completed in 1924, however, plans were begun to reroute and improve the conditions of the highway. The project involved creating a new, wider, four-lane route further west that would connect Seattle and Tacoma, Washington, more directly (Kramak, 2010). The new roadway was completed in 1928 and acquired the title of Highway 1, while the original eastern route was renamed Highway 5 (Caster, 2007). The new Highway 1 became known as the Pacific Highway. Over the years, various parts of Highway 1 acquired alternative names, including the portion known as Pacific Highway S, which starts near Federal Way, Washington, and continues north, through Kent, Des Moines, and SeaTac, Washington (Kramak, 2010).

In 1926, Pacific Highway (HWY 1) was included as a numbered U.S. Highway (US 99) (U.S. Route 99, 2013). The following decades witnessed the rapid growth of businesses along the highway and the formation of a new auto-oriented roadside culture characterized by a proliferation of motels, restaurants, and rest stops (Des Moines Historical Society, 2007). Increased automobile ownership changed people's perceptions about distance and allowed populations to sprawl around urban centers, increasing the number of residents in suburban towns and cities, including SeaTac, Des Moines, Kent, and Federal Way (Boyles, 2010).

Federal Way was originally settled as a rural logging community in the late 1800s. In 1928 , when the Pacific Highway (HWY 1/US 99) between Tacoma and Seattle opened, it linked Federal Way to the larger neighboring communities, spurring economic and residential development. The name Federal Way came from an eponymous school built in 1929 on Pacific Highway S (Caster, 2007). During the 1950s, Federal Way witnessed substantial growth, transforming from a small lumber town into a metropolitan area. Auto-oriented businesses emerged and thrived along the Pacific Highway. Community growth was bolstered by Boeing and Weyerhaeuser industries in the 1960s. In 1968, Weyerhaeuser purchased 430 acres of land for its corporate headquarters, which opened in April 1971 (Caster, 2007). Federal Way was incorporated as a city in 1990.

The property at 2101 South 324th Street in Federal Way, Washington, which is a clubhouse for a mobile home park constructed in 1966, is not eligible for listing in the NRHP. The property is not eligible for the NRHP under Criterion A, which applies to buildings that are associated with events that have made a significant contribution to the broad patterns of history, as no significant events are associated with this property. To be eligible for the NRHP under Criterion B, a property must be directly associated with a person considered significant within a historic context whose specific contribution to history has been both identified and documented. No such person who meets that definition is linked to this building. The property is not eligible for the NRHP under Criterion C as it is a typical mid-twentieth century building and does not embody the distinctive characteristics of a type, period, or method of construction; it is not the work of a master and does not possess high artistic value. The property is not eligible for the NRHP under Criterion D for information potential because the materials and construction methods of the building do not convey important information that could contribute to understanding history or prehistory. Therefore, the property is not eligible for listing in the NRHP because it does not meet any of the eligibility criteria. In addition the property is altered including the replacement of the original roof and some windows and a large addition. As a result, the building has lost integrity of materials and design. The building retains integrity of workmanship, setting, location, feeling, and association.

Physical description:	2101 South 324th Street is a one-story, wood frame, 6,510-square foot clubhouse constructed in 1966 that is associated with the Belmor Park mobile home community. The irregular plan building, which is constructed on a poured concrete foundation and has a 1,290-square foot finished basement, is primarily clad in wood board and batten siding. Non-original metal shingles cover the large cross gabled roof with deep open eaves. All of the visible windows contain fixed, single-lights. The building is composed of two parts: the T-shaped original building and a large rectangular plan building that extends from the south elevation of the east wing. The date of the addition is unknown. Two sets of double glass and metal doors are located in the center of the front (north) elevation and serve as the main entrance. This center section of the façade, which is covered by the primary front gabled roof, projects out and has a double-height with large, exposed rafter tails under the open gable. A large interior slope stone chimney protrudes from the west side of the roof over the central entrance. Above the two sets of double doors is a row of four, large, fixed, singe-light quadrilateral windows that extend from the top of the entrance to just under the roof. The east and west elevations of the projecting entrance area each contain two levels of windows, each with three, fixed, single-light windows. Behind the main entrance, the south end of the front gabled roof widens to cover the clubhouse's wider, central section. Wings extend east and west from the center of the building's east and west elevations, creating a T shape. The side wings are covered by side gabled roofs that cross the primary front gable. The north elevation of the west wing contains two adjacent rows of four, fixed, single-light windows, while the north elevation of the east wing contains no fenestration. A small, rectangular plan addition likely used for storage extends from the east elevation of the east wing and is covered by a hipped roof with a lower roof height. The small addition's east elevation contains a vehicle bay with a retractable metal door. A large, rectangular plan addition extends from the south elevation of the small storage addition and is covered by a steeply pitched, corrugated metal, front gabled roof with flush eaves. The exterior walls, which are primarily clad in board and batten siding, extend into low parapets on the gabled (north and south) elevations. The center of the large addition's east elevation contains four pairs of large, fixed, single-light windows that extend the entire height of the exterior wall. A circular road surrounds the property, which includes a front parking area, several concrete walking paths, and green space. A small driveway leads to the circular road from South 324th Street, passing a small gatehouse. The gatehouse has a front gabled roof covered in metal shingles and exterior walls clad in board and batten siding. The north and west elevations of the gatehouse each contain a replacement two-light horizontal sliding window. According to the King County Assessor's website, a 10 by 20-foot building used as a cable/internet building to service the golf club and its members was constructed on the property circa 2007. The small service building is not visible from the public right-of-way. The residential community, which contains 331 property lots, is located south of the clubhouse on 62.74 acres of land. The mobile homes were all built between 1964 and 2012.

Surveyor Opinion

Significance narrative:

The Belmor Mobile Home Park (which the community has renamed Belmor Park Golf & Country Club) was constructed in 1966 by a joint venture of Sherwood Development Company and San Juan Homes. Jack Woodman designed the clubhouse, which Gavin Brown constructed. Raymond Coleman built the golf course. Additional building and engineering were completed by Mallory Company of Woodinville, Hugh Goldsmith Associates, and Turf and Toro, who engineered the sprinkler system (Seattle Times 1966a). In response to a previous historic property inventory form, the Federal Transit Authority (FTA) determined the primary permanent building in the Belmor Mobile Home Park, the clubhouse (1966), not eligible for listing in the NRHP in 2014 (DAHP 2020). However, the clubhouse is only one element of a resource that includes additional associated buildings, structures, and sites that could, potentially, qualify as a historic district.

As described by the National Park Service, a historic district “possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development” (NPS 1997). In addition, historic districts consist of contributing and non-contributing resources thematically linked by architectural style or designer, date of development, distinctive urban plan, and/or historic association (NPS 1997).

Belmor Mobile Home Park is most appropriately evaluated as a potential historic district with a variety of buildings, structures, and sites that could potentially qualify as contributing resources to a district united historically by plan and physical development. The Belmor Mobile Home Park includes:
- a clubhouse (1966)
- 336 mobile homes (1964–2020);
- a designed neighborhood and landscape with associated circulation patterns (1966);
- a nine-hole golf course (1966);
- a garage and maintenance shed (1966);
- the Belmor Mobile Home Park site.

Integrity of the Belmor Mobile Home Park
According to NPS guidance for evaluating historic districts, "for a district to retain

integrity as a whole, the majority of the components that make up the district's historic character must possess integrity even if they are individually undistinguished. In addition, the relationships among the district's components must be substantially unchanged since the period of significance” (NPS 1997). Integrity evaluation takes into account the impact of intrusions into the potential district, their size, scale, design, and relative number. “The majority of the components that add to the district's historic character, even if they are individually undistinguished, must possess integrity, as must the district as a whole” (NPS 1997). Additionally, “a district is not eligible if it contains so many alterations or new intrusions that it no longer conveys the sense of a historic environment” (NPS 1997).

The Belmor Mobile Home Park is made up of numerous resources. Integrity is assessed first for each resource and then for the subdivision as a whole. In the case of a resource type with multiple examples, namely the mobile homes themselves, which are inherently impermanent and most appropriately understood collectively, one integrity statement is made for the entire resource type, as per DAHP recommendations during consultation.

Clubhouse (1966): The clubhouse retains integrity of location, setting, workmanship, feeling, and association, as it remains in place and continues to serve as a recreational amenity for the surrounding development. The replacement of the roof and some windows, along with a large addition (natatorium), have diminished its integrity of design and materials, as indicated in a 2014 evaluation that led FTA to determine that the clubhouse was not eligible for listing in the NRHP (DAHP 2020).

336 mobile homes (1964–2020): Approximately 35 percent of existing homes date to the period of significance (1975 or earlier), and many of those have been renovated, according to the King County Assessor. Survey indicates that the majority of the park's mobile homes no longer retain the character-defining features of historic-period examples, including compact massing, metal siding and windows, and rectangular plans with minimal or non-existent porches and stoops. Additionally, more than 65 percent of the historic-period resources have been lost. Based on the significant loss of original material, the remaining mobile homes, as a group, retain integrity of location, setting, and association, but have lost integrity of design, materials, workmanship, and feeling.

Designed neighborhood and landscape with associated circulation patterns (1966): The subdivision landscape retains much of its original layout, including its character-defining circulation patterns, and angled parking pads for trailers and mobile homes that sit side-by-side alongside paved, curvilinear roadways. Walking/golf cart paths circulate through the development and through golf course fairways. Landscaping includes mature trees, lawns, and other plantings. The neighborhood, roads, landscaped areas, and paths that serve the subdivision retain integrity of location, setting, materials, workmanship, feeling, and association. The addition of wastewater management facilities within former green spaces have slightly diminished the landscape's integrity of design.

Nine-hole golf course (1966): Belmor Mobile Home Park was designed around the five fairways of a nine-hole golf course, all of which remain in place and retain their character-defining greens and sand pits. Additionally, a putting green remains near the clubhouse. The golf course retains integrity of location, although the replacement of historic-period mobile homes and the addition of water retention facilities on its perimeter have diminished its integrity of setting and design. The golf course retains integrity of location, materials, workmanship, feeling, and association.

Garage and maintenance shed (1966): The garage and maintenance shed at the southwest end of the development have been altered by additions and replacements and no longer retain their character-defining plan and materials. The garage and maintenance shed retain integrity of location, setting, feeling, and association, but have lost integrity of design, materials, and workmanship.

The Belmor Mobile Home Park's exterior site is located in a developed section of Federal Way and is now surrounded by residential and commercial development from the late twentieth century. Based on construction that replaced the forest that once surrounded Belmor and contributed to the site's character, the subdivision site appears to retain integrity of location, design, materials, workmanship, feeling, and association, although it has lost integrity of setting.

Evaluation
Belmor Mobile Home Park is best understood within the local, state, and national context associated with the housing boom that post-dated World War II in the United States. Development in King County boomed, and developers built extensive subdivisions for Seattle’s growing labor force. As noted by the Seattle Times’ Real Estate writer and editor, Alice Staples, “It was soon after the Second World War that the bulldozer became infamous as it crashed its way through the virgin areas, and builders rushed to provide the needed housing. Everything fell in the wake of the huge machines. Lot by lot, the forest receded and the buyers lost the backdrop of trees which had framed their houses when they bought. Suddenly, they were in raw new subdivisions” (Staples 1968).

History of Mobile Home Developments:
While many post-war subdivisions were constructed for single-family residences, mobile home parks in Washington, either for travel trailers or more permanent mobile homes, date to as early as 1945, when the Barnes Automobile Trailer Camp was constructed in Vancouver, Washington. WISAARD states that FTA determined the development not eligible for listing in the NRHP in 2008. WISAARD documents three additional trailer parks from the 1940s and 1950s, all of which have been determined not eligible for listing in the NRHP. These include the Coast Post Trailer Park in Olympia, which was constructed in 1948 and determined not eligible for listing in the NRHP by DAHP in 2016; the Riverbend Mobile Home Park outside Renton, constructed in 1957 and determined not eligible for listing in the NRHP by DAHP in 2018; and the Tip Top Mobile Home Park in Kent, which began with a single-family residence and expanded into a collection of cottages and trailers at an unknown date. FTA determined the Tip Top Mobile Home Park not eligible for listing in the NRHP in 2014 (DAHP 2020). Based on WISAARD records and aerial photographs, these mobile home parks appear to remain in place today.

By the late 1950s and early 1960s, housing developments of all kinds, including mobile home subdivisions, became increasingly common throughout Washington and the country, and many of them incorporated recreational amenities. In 1958, for example, John F. Long of Home Builder, Inc., provided a published plan for a possible subdivision of single-family homes grouped around green spaces, each of which held a fairway of an integrated nine-hole golf course. Like the future Belmor development, Long’s subdivision plan was generally square, with limited access from exterior streets and curvilinear roadways throughout the interior. The golf course's first three holes were centrally located, while the final six were located along narrow fairways bordered by single-family homes throughout the surrounding development (Rosenthal 1960). Referred to as "golf course subdivisions," developments like this heightened property values for developers and grew increasingly popular with buyers. As described by the American Society of

Planning Officials, "the fairways are located in the interior of the blocks. Homes are built in the conventional side-by-side manner, but the rear lot lines adjoin the golf course itself. One reason for building this type of subdivision is the additional value imputed to each lot, which, according to a study by the Urban Land Institute, has been estimated at approximately $2,000 for an average lot" (Rosenthal 1960).

In response to the growing popularity of "golf course subdivision," new single-family residential developments increasingly integrated clubhouses, pools, and golf courses into their neighborhood plans. Mobile home parks, however, were often a harder sell for developers than single-family residential developments and less likely to feature high-end amenities. Considered a low-cost option for housing new arrivals, and particularly those with children, mobile home or trailer parks were touted by builders but unpopular with surrounding residents. According to a Seattle Times article on the pros and cons of mobile home parks in commercial and light manufacturing zones, developers complained about their limited (and expensive) land options and the public's knee-jerk negative response to mobile home projects. “About the only contribution the public has made so far is to protest each time a mobile-home park is proposed, a developer said” (Staples 1966).

While developers sought to create more mobile home subdivisions, mobile homes themselves also evolved throughout the 1960s, becoming more permanent and losing the “mobility” for which they were known. They grew larger, more comfortable, and were soon seen as a permanent housing option for those retiring, those just growing their young families, and those who wanted a close-knit community but didn’t want to maintain a large yard.

Developers, perhaps in response to these conditions, began designing upscale examples of mobile home parks in the 1960s, some of which prioritized recreational opportunities, a trend already popular in subdivisions in vacation destinations like Florida, where Temple Terrace Estates, considered one of the first golf course communities, had invited wealthy owners to live and play golf since the 1920s--as it does today (Hostetler 2011). In 2013, Temple Terrace became the first 18-hole golf course in Florida to be listed in the NRHP (Reams 2013). In 1960, Tucson Estates, a mobile home park in Arizona, was master-planned to include 1,684 mobile home lots, some of which were adult only, as well as an 18-hole golf course (Tucson Estates 2020). Tucson Estates, which remains in place today, was highlighted by planner Frederick H. Bair Jr. in a 1960 professional paper for the American Society of Planning officials (Bair 1961). By 1960, according to Bair, ten percent of new non-farm single-family dwellings were mobile homes, up from seven percent in 1955. While municipalities rushed to create codes, standards, and regulations for mobile home subdivisions, planners worked on the effort to integrate them into existing communities. By 1960, there were approximately 50 mobile home subdivisions in America, according to Bair, "of which a small part are very good and most are not" (Bair 1961).

As mobile homes were hardly mobile anymore, Bair thought their neighborhoods were more appropriately understood as subdivisions. Therefore, good mobile home subdivisions should echo neighborhoods, including clusters, cul de sacs, loops and courts with narrow roads and walking paths through the grounds. Quiet, private areas should be available, and cars should move slowly and carefully. "And the trees should be there, not only to discourage hot-rodding adolescents of all ages, but as part of a carefully preserved (if possible) and carefully planted (if not) general landscaping. Nothing builds more character into a subdivision than trees, and nothing about a subdivision grows more slowly. A good subdivision should have a general landscaping plan as well as a plan for streets and lots, and the landscaping plan should start early, making the most of the native vegetation and the natural topography" (Bair 1961).

Bair also noted that these mobile home subdivisions needed amenities for residents and should follow the best practices of single-family residential developments, as defined in professional planning literature like G. H. Crabtree Jr.'s "Developing Golf Course Subdivisions," published in the September 1958 issue of the Urban Land Institute's Urban Land newsletter. While it is not clear if Washington developers relied on papers like Crabtree's, the design of Belmor suggests that its developers followed a growing body of literature on the topic of subdivision design.

Mobile Home Subdivisions in Washington:
Washington state may not have had the sunny reputation of Florida or the southwest, but by 1961, King County had its own upscale mobile home subdivision and numerous other developments with their own golf courses. Bow Lake Trailer Town in SeaTac was constructed by 1961, five years ahead of Belmor, and offered "enclosed playground, modern exclusive private club and recreational center with swimming pool, dancing, game rooms, shuffle boards, golf green, horse shoe, etc., plus a modern shopping center all within the park" (Seattle Times 1961). Bow Lake Trailer Town did not accept children at all or pets without leashes. It was, according to the Seattle Times, "oriented toward middle-aged or retired couples" (Andrews 1972). Today, aerial photos show that the Bow Lake mobile home park remains on the edge of Sea-Tac International Airport and includes an activities center and a large, naturalistic park, although no golf course is evident. In 1962, soon after Bow Lake was completed and four years before Belmor was constructed, the Seattle Times ran ads for the new Crossroads Village Apartments in Bellevue, which included a golf course on its list of amenities along with a pool and wall-to-wall carpeting (Seattle Times 1962). The Crossroads Par 3 Golf Course remains today. Other examples of golf course-centered multi-family developments included Lakeway Mobile Estates, a 100-unit mobile home park near Bellingham, which was constructed, like Belmor, in 1966, and advertised as fronting on a golf course with additional recreational facilities including "swimming pool, recreation hall, community kitchen, workshop and putting area" (Seattle Times 1966b). While the mobile home park remains, the Lakeway Golf Course does not.

The enthusiastic development of new golf courses in the area was noted in a 1967 Seattle Times article that detailed Belmor's construction and claimed that "golf course construction in the Seattle metropolitan area is going ahead at a hectic, unprecedented pace. Investors trying to keep abreast of the region's economic boom are pouring millions into 12 new courses" (Seattle Times 1967a).

By 1966, when Sherwood Development Company was constructing Belmor Mobile Home Park, the company had already created four other high-profile residential developments around and through golf courses in King County. Belmor Mobile Home Park was the only one of the five for mobile homes (Staples 1966). Additionally, Sherwood developed Fairwood, also opened in 1966, a residential community of 565 single-family homes built around and through a golf course in Maple Valley that was praised for its selective development around existing trees; Tam O'Shanter, built as a single-family residential neighborhood around a golf course and park in Bellevue in 1965; Brae Burn, a single-family residential neighborhood built around a golf course in Redmond; and Twin Lakes in Federal Way, also a community of single-family homes constructed in the mid-1960s around a golf course. All five communities remain in place today. While the four residential subdivisions attribute their golf courses to popular landscape architect, William G. Teufel, research did not reveal that Teufel contributed to the design of Belmor's golf course.

Sherwood Development Company placed Belmor Mobile Home Park in an area that was once a forested, undeveloped section of Federal Way. The company cleared the land and constructed the development with sections reserved for families and adults, although at times, the development appears to have been entirely adult-only (Seattle Times 1967b). Today, Belmor has evolved into a retirement community for individuals aged 55 years and older.

Eligibility
Belmor Mobile Home Park, evaluated here as a potential historic district made up of multiple resources, is indicative of local, state, and national trends in the development of new housing during the post-war boom in the United States, including the development of golf course subdivisions. It was, like other mobile home parks and single-family developments of the era, responsive to trends in subdivision planning and recreation. It appears to follow closely the designs of earlier planned subdivisions, including Long’s 1958 plan for a golf course subdivision and the 1961 Bow Lake Trailer Town in SeaTac. It was one of five golf course communities constructed by the same developer in the mid-`960s, but the only one built as a mobile home park. The development provided a lower cost, attractive neighborhood with recreational amenities, and has local significance under Criterion A for its association with events and trends that made a contribution to the broad patterns of local, state, or national history (Criterion A).

Background research did not reveal any association of the resource with the lives of significant persons (Criterion B).

Belmor Mobile Home Park was designed to resemble typical residential subdivisions and included, for instance, curvilinear streets, minimal through-traffic, added green space, and additional recreational amenities like a clubhouse and golf course, all character-defining features of subdivisions of the era (McAlester 2013:68). The mobile home park does possess the distinctive characteristics of its type, period, and method of construction. It does not appear to represent the work of a master, or to possess high artistic values, but it could represent a significant and distinguishable entity whose components may lack individual distinction (i.e., contribute to an existing or potential district) (Criterion C).

Finally, the mobile home development and its architectural resources were built of common construction methods and well-known materials and are unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Belmor Mobile Home Park, evaluated here as a potential historic district, is locally significant under Criteria A and C for its association with development trends in Washington and throughout the United States during its period of significance (1966 to 1975). Its contributing resources, were the district eligible, would include the subdivision's designed neighborhood and landscape with associated circulation patterns; golf course; clubhouse; maintenance shed; and collection of mobile homes. However, based on a loss of integrity, particularly the loss of historic-period motor homes and alterations to its clubhouse and maintenance shed, the subdivision "contains so many alterations or new intrusions that it no longer conveys the sense of a historic environment" (NPS 1997). As noted above, the NPS requires that the majority of components that make up a potential district's historic character must possess integrity, and the relationship between the components must be substantially unchanged. In the Belmor Mobile Home Park, the subdivision's neighborhood landscape and golf course retain sufficient integrity to contribute to a potential district; but the clubhouse, the great majority of the mobile homes, and the maintenance shed have lost integrity and would not be eligible as contributing resources to a potential historic district. As the subdivision's designed neighborhood, landscape, and golf course are not sufficient in and of themselves to qualify as a historic district within the Belmor Mobile Home Park site, HRA recommends that the Belmor Mobile Home Park is not eligible for listing in the NRHP under any criteria.

Physical description:

According to the King County Assessor, the Belmor Mobile Home Park, addressed as 2101 S 324th Street, was constructed in 1966. It is located on 62.74 acres and includes two permanent buildings, a clubhouse and maintenance building, both constructed in 1966 (King County Assessor 2020). Newspaper articles note that the development was constructed with 336 mobile home spaces (Seattle Times 1966a). Today, according to the King County Assessor:

- 118 mobile homes (approximately 35 percent of the total) date to 1975 or earlier;
- 218 mobile homes (approximately 65 percent of the total) host newer mobile homes or are vacant;
- 82 of the newer mobile homes (approximately 25 percent of the total) date from 2000 or later; and
- at least 10 mobile homes have been remodeled since 2000.

The development is located on an irregularly shaped parcel directly west of I-5, south of The Commons at Federal Way, and to the east and north of commercial and residential development. The mobile home park is gated and accessible via one entrance off S 324th Street, where a circular road around the clubhouse leads to paved roads throughout the development, all of which are somewhat curvilinear and lined with diagonal parking spaces for mobile homes, most of which are filled. Lines of mobile homes are grouped around the perimeter of green spaces, all of which include golf holes. The golf greens are long, maintained lawns that include some paved pathways and one to two holes, each with one to two associated sand traps. Additionally, the development includes two catchments or stormwater storage facilities planted with trees and shrubs and secured with fencing. Additional landscaping is minimal but includes a small number of benches with associated plantings and a terraced slope with benches and shrubs at the site’s southwest corner. Additionally, the site includes some trees and planting strips along some paths, on slopes, as boundaries or privacy screens within the development, and in the secured catchments.

The development’s clubhouse was surveyed in 2014, at which time the FTA determined it not eligible for listing in the NRHP under any criteria due to a lack of significance and integrity (DAHP 2020). As noted previously, the building is irregular in plan, constructed on a poured-concrete foundation, and includes a basement. It is clad in board-and-batten, and topped by a cross-gabled metal roof with deep eaves. Windows are large, fixed, single lights, and two sets of double doors are located on the facade, which faces north toward parking. The building includes a large addition to the southeast. Previous surveyors did not provide a date of construction for the addition. However, aerial photographs indicate that it was added between 1998 and 2006 (NETROnline 2020). The addition is a rectangular natatorium with some board-and-batten siding but primarily walls of floor-to-ceiling windows.

The second permanent building is an irregularly shaped garage and maintenance shed at the southwest corner of the site on a large, paved pad. The building includes two front-gabled, wood-framed buildings with overhead or swinging garage doors attached to a flat-roofed central bay and including a large shed-roofed mass to the rear, as well as a temporary gambrel-topped storage shed on skids. The building is clad in a combination of vertical boards and wood sheet and is topped by a combination of corrugated metal and asphalt shingles.

The mobile homes themselves vary in size, style, and materials, although many appear to be new or recently renovated with concrete board siding, vinyl windows, and covered porches.

Detail Information

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Databas (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 33003 24th Avenue S, Federal Way, is located in King County. According to the county assessor, the structure was built in 1951 and is a single family dwelling. The building has a single-family form with an attached garage.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1951), 33003 24th Avenue S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered, and the encroaching construction of I-5. The building retains integrity of location.

Evaluation

The building at 33003 24th Avenue S was constructed in 1951 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates recommends 33003 24th Avenue S does not retain integrity from its period of construction (1951) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1951, the residential building at 33003 24th Avenue S fronts east (King County Assessor 2020). The one-story, rectangular building sits on a poured-concrete foundation and is clad in a combination of horizontal board, vertical T1-11, and shingles (wood or composition). The building is topped by a side-gabled roof clad in asphalt roofing. Windows throughout are vinyl framed in altered fenestration. The building features a sliding glass front door beneath a gabled porch. An attached garage is located on the south side of the building.

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Databas (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 33035 24th Avenue S, Federal Way, is located in King County. According to the county assessor, the structure was built in 1957 and is a single family dwelling. The building has a single-family form.

Surveyor Opinion

Significance narrative:	Integrity From its period of construction (1957), 33025 24th Avenue S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered, and the surrounding construction of heavy commercial development. The building retains integrity of location. Evaluation The residential building at 33025 24th Avenue S was constructed in 1957 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D). Historical Research Associates, Inc. recommends 33025 24th Avenue S does not retain integrity from its period of construction (1957) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.
Physical description:	Built in 1957, according to the King County Assessor, the residential building at 33025 24th Avenue S fronts east (King County Assessor 2020). The one-story, rectangular building sits on a poured-concrete foundation and is clad in a combination of board-and-batten and wood shingles. The building is topped by a side-gabled roof clad in asphalt roofing. Windows throughout are vinyl-framed in altered fenestration. The building was likely originally constructed with a garage on the north side of the east face, which has been converted to living space.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1948), 33049 24th Avenue S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows, alterations to the massing via the large addition to the north, and the encroaching construction of I-5. The building retains integrity of location.

Evaluation

The building at 33049 24th Avenue S was constructed in 1948 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates recommends 33049 24th Avenue S does not retain integrity from its period of construction (1948) and is not eligible for listing in the National Register of Historic Places or Washington Heritage Register under any criteria.

Physical description:

Built in 1948, the residential building at 33049 24th Avenue S fronts east (King County Assessor 2020). The one-story, rectangular building sits on an unknown foundation and is clad in wood clapboard. The building is topped by a side-gabled roof clad in asphalt roofing; the roofline rises to the north, evidence of a large addition to the rear and, possibly, north. Windows throughout are vinyl framed in altered fenestration. The entry is located in a recessed porch. The former garage (on the south end of the east face) was converted to living space.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1975), 33211 24th Avenue S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows and, likely, cladding, which have been either altered or covered, and the encroaching construction of I-5. The building retains integrity of location.

Evaluation

The building at 33211 24th Avenue S was constructed in 1975 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates recommends 33211 24th Avenue S does not retain integrity from its period of construction (1975) and is not eligible for listing in the National Register of Historic Places or Washington Heritage Register under any criteria.

Historic Property Report

Physical description:	Built in 1975, the residential building at 33211 24th Avenue S fronts north away from the street (King County Assessor 2020). The one-and-one-half-story, rectangular building sits on a poured-concrete foundation and is clad in horizontal board siding. The building is topped by a side-gabled roof clad in asphalt roofing. Windows throughout are vinyl framed, likely in altered fenestration. The central entry on the north face is located beneath a shallow shed roof projection. A detached garage with a side-gabled roof is located to the north.

Detail Information

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Databas (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 33217 24th Avenue S, Federal Way, is located in King County. According to the county assessor, the structure was built in 1969 and is a single family dwelling. The building has a single-family form with an attached garage.

Surveyor Opinion

Significance narrative:	Integrity From its period of construction (1969), 33217 24th Avenue S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a perceived loss of all historic-period windows and cladding, the conversion of a garage to living space, and the encroaching construction of I-5. The building retains integrity of location. Evaluation The building at 33217 24th Avenue S was constructed in 1969 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D). Historical Research Associates recommends 33217 24th Avenue S does not retain integrity from its period of construction (1969) and is not eligible for listing in the National Register of Historic Places or Washington Heritage Register under any criteria .
Physical description:	Built in 1969, the residential building at 33217 24th Avenue S fronts east (King County Assessor 2020). The L-shaped, one-story building sits on a poured-concrete foundation, is clad in horizontal wood clapboard siding, and is topped by a side-gabled roof clad in asphalt roofing. Windows throughout are aluminum framed, likely in altered fenestration. The projecting massing on the north was constructed as a garage but was then converted to living area at an unknown date, according to plans provided by the King County Assessor (King County Assessor 2020). The former garage has a pedestrian entrance on the north side. A second front entrance is located on the main massing.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1948), 2245 S 333rd Street retains poor integrity of materials, design, workmanship, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered. The encroaching construction of I-5 and the addition of a residence (2241 S 333rd Street) on the same parcel but at a separate address has altered the integrity of setting. The buildings retains integrity of location.

Evaluation

The residential buildings at 2241 S 333rd Street and 2245 S 333rd Street were constructed between 1948 and 1989 and do not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The buildings do not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the buildings were built of common construction methods and well-known materials and are unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates recommends the residences addressed as 2241 S 333rd Street and 2245 S 333rd Street do not retain integrity from the period of construction (1948) and are not eligible for listing in the National Register of Historic Places or Washington Heritage Register under any criteria.

Physical description:

Built in 1948, the residential building at 2245 S 333rd Street fronts north (King County Assessor 2020). The one-story, rectangular building sits on an unknown foundation and is clad in stucco siding. The building is topped by a side-gabled roof clad in asphalt roofing. Windows throughout are aluminum framed; a central pedestrian entry with a wood door is accessed via a two-step concrete stoop.

A second building to the west dates to outside the historic period (1989) and was likely originally constructed as a garage but altered to living space (King County 2020). It is now addressed as 2241 S 333rd Street. The former garage is a one-story, rectangular building on an unknown foundation, clad in a combination of horizontal (vinyl) and vertical (T1-11) siding. The building is topped by a front-gabled roof clad in asphalt roofing. Windows on the north face are metal; entries are located on the east and west faces. A detached building with a garage door was located to the rear (south).

Surveyor Opinion

Significance narrative: Integrity

From its period of construction (1962), 2230 S 336th Street retains poor integrity of materials, design, workmanship, feeling, and association, due to a loss of all historic-period windows and cladding, which have been either altered or covered. The building retains integrity of location and setting.

Evaluation

The residential building at 2230 S 336th Street was constructed in 1962 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Based on a lack of significance and integrity, Historical Research Associates recommends 2230 S 336th Street is not eligible for listing in the National Register of Historic Places or Washington Heritage Register under any criteria.

Physical description: Built in 1962, the residential building at 2230 S 336th Street fronts south (King County Assessor 2020). The one-and-one-half story, rectangular building sits on an unknown foundation and is clad in T1-11 siding. The building is topped by a front-gabled roof clad in asphalt roofing. The building is located at the end of a private drive and is minimally visible from the ROW; all visible windows appear to be vinyl framed in altered fenestration. A semi-circular vinyl-framed window is located on the south face above the recessed porch and entry. A single-story projection below a ribbon of windows is located off the rear.

Detail Information

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Database (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 2234 S 336th Street, Federal Way, is located in King County. According to the county assessor, the structure was built in 1959 and is a single family dwelling. The building has a single-family form.

Surveyor Opinion

Significance narrative: Integrity

From its period of construction (1959), 2234 S 336th Street retains poor integrity of materials, design, workmanship, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered. The building retains integrity of location and setting.

Evaluation

The residential building at 2234 S 336th Street was constructed in 1959 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Based on a lack of significance and integrity, Historical Research Associates recommends 2234 S 336th Street is not eligible for listing in the National Register of Historic Places or Washington Heritage Register under any criteria.

Physical description: Built in 1959, the residential building at 2234 S 336th Street has no facade (King County Assessor 2020). The one-story building sits on an unknown foundation and is clad in fiber-cement board siding. The building is topped by a cross-gabled roof clad in asphalt roofing. All windows are vinyl framed in altered fenestration. A pedestrian entry is located within an enclosed, shed-roofed arctic entry on the north face; the entrance faces west

Surveyor Opinion

Significance narrative:	Integrity From its period of construction (1967), 33366 20th Avenue S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows and some cladding, which have been either altered or covered, and the surrounding construction of heavy commercial development. The building retains integrity of location. Evaluation The residential building at 33366 20th Avenue S was constructed in 1967 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building, as initially constructed, may have embodied the distinctive characteristics of a Contemporary Split- or Tri-level house; however, the loss of integrity of materials (windows, cladding) and setting, specifically, have rendered the building unable to convey significance as a representative example of its type (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D). Historical Research Associates, Inc. recommends 33366 20th Avenue S does not retain integrity from its period of construction (1967) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.
Physical description:	Built in 1967, according to the King County Assessor, the residential building at 33366 20th Avenue S was originally constructed with the facade on the southwest, though access now seems to be primarily from the northeast (King County Assessor 2020). The one-story rectangular building sits on a poured-concrete foundation and is clad in a combination of horizontal boards, T1-11, and plywood. The building is topped by an off-center, front-gabled roof with exposed rafter tails clad in asphalt roofing. The southwest face features an inset porch with a wood door with sidelights. Windows throughout appear to be vinyl-framed in altered fenestration. The building may be an example of a Tri-level Contemporary.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1950), 1820 S 336th Street retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of historic-period windows and possibly cladding, and the surrounding construction of heavy commercial development. The building retains integrity of location.

Evaluation

The residential building at 1820 S 336th Street was constructed in 1950 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

HRA recommends 1820 S 336th Street does not retain integrity from its period of construction (1950) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1950, according to the King County Assessor, the residential building at 1820 S 336th Street originally fronted south, though a fence now shields the building (King County Assessor 2020). The one-and-one-half-story, rectangular building sits on an unknown foundation and is clad in a combination of brick veneer and horizontal boards in the gable ends. The building features a telescoping front-gabled roof clad in asphalt roofing. A projecting porch supported by paired posts is somewhat visible from the ROW, as are a combination of vinyl-, wood-, and possibly aluminum-framed windows.

Surveyor Opinion

Significance narrative:	Integrity From its period of construction (1947), 1812 S 336th Street retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered, and the surrounding construction of heavy commercial development. The building retains integrity of location. Evaluation The motel building at 1812 S 336th Street was constructed in 1947. It is not located on Pacific Highway but on a crossing street, where it is generally obscured from view. It was not designed as a roadside attraction. The motel does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history, including development along transportation corridors like Pacific Highway (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody any distinctive characteristics of a type, period, or method of construction. It is not a distinctive example of motel/hotel architecture nor an example of “googie” roadside architecture, which often features highly visible amenities and neon signage. It does not represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D). Historical Research Associates recommends 1812 S 336th Street does not retain integrity from its period of construction (1947) and does not meet any criteria for listing in the National Register of Historic Places or Washington Heritage Register.
Physical description:	Built in 1947, according to the King County Assessor, the motel building at 1812 S 336th Street has no facade but fronts west towards the parking lot (King County Assessor 2020). The L-shaped, one-story building sits in a poured-concrete foundation and is clad in wood shingle siding. The building is topped by a cross-gabled roof clad in asphalt roofing. Windows throughout appear to be vinyl-framed in altered fenestration. A detached concrete block building is located northwest of the motel and may be the caretaker’s residence or additional hotel space; the building features a hip roof, rounded corners, and vinyl windows.

Detail Information

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Database (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 33532 18th Avenue S, Federal Way, is located in King County. According to the county assessor, the structure was built in 1954 and is a single family dwelling. The building has a single-family form.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1954), 33532 18th Avenue S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered, conversion of the garage to living space, and the surrounding construction of heavy commercial development. The building retains integrity of location.

Evaluation

The commercial building at 33532 18th Avenue S was constructed in 1954 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 33532 18th Avenue S does not retain integrity from its period of construction (1954) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1954, according to the King County Assessor, the residential building at 33532 18th Avenue S fronts west . The one-story, rectangular building sits on a poured-concrete foundation and is clad in vinyl siding. The building is topped by a side-gabled roof clad in asphalt roofing. Windows throughout are vinyl-framed in altered fenestration. The front door is fiberglass. The building was likely originally constructed with a garage that was converted to living space.

Surveyor Opinion

Significance narrative:

Integrity
From its period of construction (1951), 33606 Pacific Highway S retains poor integrity of materials, design, workmanship, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered. The building retains integrity of location and setting.
Evaluation
The commercial building at 33606 Pacific Highway S was constructed in 1951 and does not appear, based on a review of historic maps and local histories, to have any associatior with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 33606 Pacific Highway S does not retain integrity from its period of construction (1951) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1951, according to the King County Assessor, the commercial building at 33606 Pacific Highway S has no facade but fronts north and west towards a parking lot (King County Assessor 2020). The one-story, L-shaped building sits on a poured-concrete foundation and is clad in stucco. The building is topped by a flat roof with parapet clad in an unknown roofing material. Awnings over entryways are clad in either tile or stamped metal. Windows and doors throughout vary, though most windows are metal commercial.

Surveyor Opinion

Significance narrative:	Integrity From its period of construction (1947), 33903 Pacific Highway S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered, and the surrounding construction of heavy commercial development. Additionally, the building may have been originally constructed for residential purposes. The building retains integrity of location. Evaluation The commercial building at 33903 Pacific Highway S was constructed in 1947, likely as a residence, and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D). Historical Research Associates, Inc. recommends 33903 Pacific Highway S does not retain integrity from its period of construction (1947) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.
Physical description:	Built in 1947, according to the King County Assessor, the commercial building at 33903 Pacific Highway S fronts east, though the building appears to be primarily accessed via the rear (west) face (King County Assessor 2020). The one-story, rectangular building on basement sits on a poured-concrete foundation and is clad in either precast concrete siding or parged/stucco panels, with accents of applied stone. The building is topped by a flat roof clad in asphalt roofing. Windows throughout are vinyl-framed in altered fenestration. The primary east entry is topped by a decorative pergola, which is mimicked on the north end of the east face at a second (recessed) entry. A detached garage clad and roofed in standing-seam metal is located west of the primary building.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1946), the residence at 1700 S 340th Street retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of some historic-period windows and cladding, which have been either altered or covered, and the surrounding construction of heavy commercial development, as well as a new association with a Masonic Hall dating to 1974. The building retains integrity of location.

Evaluation

The residence associated with the Masonic Center at 1700 S 340th Street was constructed in 1946, likely as a single-family residence, and later converted to housing serving the neighboring Masonic Center, constructed in 1974 for Thornton F. McElroy Lodge #302. As noted in a separate evaluation for the Masonic Center, Lodge #302 was formed in 1958 and moved into its new building in 1974. As with the lodge building itself, the residence at this location does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of state or national history, although it is somewhat significant locally for its association with Lodge #302 (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). As noted in the associated HPI, the naming of the lodge for Thornton F. McElroy appears to be primarily honorary and not indicative of a direct association with McElroy. McElroy was the first Master of Olympia Lodge, which was the first Lodge in Washington Territory, and was later the first Grand Master of the Grand Lodge of Washington (Miller n.d.). As with the lodge building, the residence at 1700 S 340th Street is a modest example of a common type. This example has been heavily altered. It does not embody the distinctive characteristics of its type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends that the residence at 1700 S 340th Street does not retain integrity from its period of construction (1946) and is not eligible for listing in the National Register of Historic Places or Washington Heritage Register under any criteria.

Physical description:

The Masonic Center residence is a residential building located to the west of the Thornton F. McElroy (Lodge No. 302) Pyramid Masonic Center at 1700 S 340th Street. Built in 1946, according to the King County Assessor, the residential building at 1700 S 340th Street fronts south (King County Assessor 2020). The one-and-one-half-story, rectangular building sits on an unknown foundation and is clad in brick veneer with wood shingle siding in the gables. The building features a cross-gabled roof clad in asphalt materials. The residential building is barely visible from the right-of-way, though at least one wood window (in the gable end) was observed, as was an exterior brick chimney and additional vinyl-framed windows on secondary elevations. The building, as observed, appeared to have been constructed in the Tudor Revival style. The residence had an associated one-story brick outbuilding with a gable roof; wood shingles matching those of the house were present in the gable end. The outbuilding featured two pedestrian entrances on the south face, and various windows.

Surveyor Opinion

Significance narrative:

Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Databas (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description:

The building at 1700 S 340th Street, Federal Way, is located in King County. According to the county assessor, the structure was built in 1946 and is a multiple family house. Also according to the county assessor, the structure was remodeled in 1946. The 1-story building has a multi-family form.

Surveyor Opinion

Significance narrative:

Integrity
From its period of construction (1974), 1700 S 340th Street retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows and doors, and the surrounding construction of heavy commercial development. The building retains integrity of location.
Evaluation
The Masonic Center at 1700 S 340th Street was constructed to serve as a local lodge for members of the Society of Freemasons in 1974 by the Thornton F. McElroy Lodge #302, founded at a separate location in 1958 after receiving a special dispensation to acquire territory from surrounding, previously established lodges (Miller n.d., Mortensen 1984). Due to its relatively young age, the building does not appear to have any specific association with events like the early formation of the Freemasons in Washington, or the founding of Lodge #302 that made a significant contribution to the broad patterns of state or national history. Locally, it possesses some significance as the social meeting hall of Thornton F. McElry Lodge #302 (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The naming of the lodge for Thornton F. McElroy appears to be primarily honorary and not indicative of a direct association with McElroy. McElroy was the first Master of Olympia Lodge, which was the first Lodge in Washington Territory, and was later the first Grand Master of the Grand Lodge of Washington (Miller n.d.). The building is modest in design, constructed of common, mass-produced materials, and does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends the Masonic Center at 1700 S 340th Street locally significant under Criterion A. It does not retain integrity from its period of construction (1974) and is, therefore, not eligible for listing in the National Register of Historic Places or Washington Heritage Register under any criteria.

Physical description:

Built in 1974, according to the King County Assessor and a history of the Lodge, the social building at 1700 S 340th Street fronts south (King County Assessor 2020; Mortensen 1984). The L-shaped, one-story building on basement sits on a poured-concrete foundation and is constructed of CMU with vertical board and batten in the gable ends. The building is topped by a cross-gabled roof clad in asphalt roofing. Windows are altered vinyl-framed in the original fenestration. The primary entrance is located beneath a portico on the south face, supported by CMU posts. Brick veneer accents the solid wood entry doors. At the time of survey, the building served as the Thornton F. McElroy (Lodge No. 302) Pyramid Masonic Center. Also located on the parcel is an apartment associated with the building, evaluated separately, and a small tool shed dating to 2018 (King County Assessor 2020).

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1966), 1724 S 340th Street retains moderate integrity of materials, design, workmanship, setting, feeling, and association. Historic-period aluminum windows appear intact, though doors and cladding have been either altered or covered and there has been surrounding construction of heavy commercial development. The building retains integrity of location.

Evaluation

The residential building at 1724 S 340th Street was constructed in 1966 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 1724 S 340th Street does not retain integrity from its period of construction (1966) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1966, according to the King County Assessor, the residential building at 1724 S 340th Street fronts south (King County Assessor 2020). The irregular/rectangular, one-story-on-basement building sits on an unknown foundation and is clad in T1-11 siding with a skirt of applied stone veneer. The building is topped by a side-gabled roof clad in asphalt roofing. Windows throughout appear to be aluminum sash, though portions of the house—including the entry—are obscured behind a latticed privacy screen. On the west face, fiberglass pedestrian doors access the basement level below an exterior deck.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1966), 1800 S 340th Street retains moderate integrity of materials, design, workmanship, setting, feeling, and association, with minimal alterations to massing via the addition of the sunroom and screened porch, changes to siding in the recessed entry (T1-11), and the surrounding construction of heavy commercial development. The building retains integrity of location.

Evaluation

The residential building at 1800 S 340th Street was constructed in 1966 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building was arguably constructed in the Ranch style, though it features none of the distinctive characteristics (aside from the low horizontal massing) that would enable the building to convey significance as a representative example of the type (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 1800 S 340th Street does not retain integrity from its period of construction (1966) and is not eligible under any criteria for listing in the National Register of Historic Places or the Washington Heritage Register.

Physical description:

Built in 1966, according to the King County Assessor, the residential building at 1800 S 340th Street fronts south (King County Assessor 2020). The one-story, rectangular building sits on an unknown foundation and is clad in a combination of wood clapboard and T1-11 siding. The building is topped by a telescoping side-gabled roof clad in asphalt roofing. The building features a shed carport and screened porch to the east. The primary entrance is located on the west side of the house, accessed via a recessed porch, and features a six-light-over-one panel door protected by a metal screen door. A sunroom is located on the west face. Windows throughout appear to be multilight and wood-framed, some with decorative wooden shutters.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1949), 1816 S 340th Street retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of at least some historic-period windows and cladding, which have been either altered or covered, and the surrounding construction of heavy commercial development. The building retains integrity of location.

Evaluation

The residential building at 1816 S 340th Street was constructed in 1949 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 1816 S 340th Street does not retain integrity from its period of construction (1949) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1949, according to the King County Assessor, the residential building at 1816 S 340th Street has no front facade; it is accessed via a driveway on the south face, with pedestrian entrances on both the east and west faces (King County Assessor 2020). The L-shaped, one-story building sits on an unknown foundation and is clad in vinyl siding. The building is topped by a side-gabled roof clad in asphalt roofing. A shed-roofed carport is located on the southeast corner. On the west face is a semi-covered deck. Windows varied, with some wood picture windows and at least one metal oriel.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1946), 1828 S 340th Street retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows and cladding, which have been either altered or covered, and the surrounding construction of heavy commercial development. The building retains integrity of location.

Evaluation

The residential building at 1828 S 340th Street was constructed in 1946 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 1828 S 340th Street does not retain integrity from its period of construction (1946) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1946, according to the King County Assessor, the residential building at 1828 S 340th Street fronts south (King County Assessor 2020). The L-shaped, one-story building sits on an unknown foundation and is clad in a combination of wood or composition shingle siding, various horizontal and vertical boards, and T1-11. The building is topped by a cross-gabled roof clad in asphalt roofing and features a central chimney. Windows throughout appear to be metal sliders in altered fenestration. A shed-roofed addition on the south face appears to have been made from reclaimed historic-period materials. A detached shed-roofed garage/shed building clad in horizontal board is located northeast of the house.

Detail Information

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Databas (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 1920 S 340th Street, Federal Way, is located in King County. According to the county assessor, the structure was built in 1953 and is a single family dwelling. The building has a single-family form.

Surveyor Opinion

Significance narrative:

The building at 1920 S 340th Street could not be surveyed from the ROW. However, a review of King County Assessor's data, as well as aerials and other online sources, made a desktop evaluation possible.

Integrity

From its period of construction (1953), the residence at 1920 S 340th Street retains integrity of location and association, as the building remains a single-family residence on its original parcel. However, alterations including encroaching development, window replacement, recladding, replacement roofing material, an addition at the northwest corner, and extensive new construction on the parcel, have diminished its integrity of setting, design, materials, workmanship, and feeling.

Evaluation

The residence at 1920 S 340th Street was constructed in 1953. The building does not appear, based on a review of historic maps and local histories, to hold any historic-period associations with important events or trends that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not suggest that the building held a strong association with the lives of significant persons (Criterion B). The building was constructed as a typical mid-20th Century Bungalow; however, it has been altered and now features few references to the historic style apart from its side-gabled roof and fenestration on the south facing facade. (Criterion C). It does not embody the distinctive characteristics of its particular type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., contribute to an existing or potential historic district). Finally, the building was constructed of common methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates recommends 1920 S 340th Street does not retain integrity from its period of construction (1953) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

According to the King County Assessor, the residence at 1920 S 340th Street was constructed in 1953 (King County Assessor 2020). However, due to the building's setback, and fencing installed in 2004 to screen the building from new construction to the north, it is not visible from the ROW. Based on data from the King County Assessor, in combinatior with aerial photographs, a desktop review was possible. The primary residence is a one-story irregularly shaped building with a south facing facade with main entrance and a ca. 1975 addition at the northwest corner. The building is topped by a side-gabled roof clad in standing-seam metal. The building appears to be clad in T1-11 with vinyl-framed windows. Also on the parcel is an outbuilding and pool. The outbuilding, located to the rear (north) of the main residence, appears to date from 1963, although its original use is unknown. It has been converted to a pool house. Also on the parcel are a detached garage, a swimming pool, and a tennis court, all of which date from between 1969 and 1980 (King County Assessor 2020; NETROnline 2020).

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1959), 34205 18th Place S retains poor integrity of materials, design, workmanship, association, and feeling, due to a loss of all historic-period windows and fenestration, and alterations to siding and roofing materials. The building retains integrity of location but has lost integrity of setting, due to heavy commercial construction to the west, north, and east.

Evaluation

The residential building at 34205 18th Place S was constructed in 1959 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building, as initially constructed, may have embodied the distinctive characteristics of the Ranch style; however, alterations to windows, siding, and other materials have rendered the building unable to convey significance as a representative example of its type (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 34205 18th Place S does not retain integrity from its period of construction (1959) and is not eligible for listing in the National Register of Historic Places (NRHP) or Washington Heritage Register (WHR) under any criteria.

Physical description:

Built in 1959, according to the King County Assessor, the residential building at 34205 18th Place S fronts east (King County Assessor 2020). The one-story-on-basement building is rectangular in plan and sits on a poured-concrete foundation. The building is clad in horizontal fiber cement board siding and is topped by a side-gabled roof clad in standing-seam metal. The building features some characteristics of the Ranch style, inclusive of its low horizontal massing and exterior brick chimney located on the north face. All windows appear to be vinyl in altered fenestration. The building's central entry features a small shed-covered concrete stoop with tile flooring that accesses the six-panel entry door on the (east) facade; the shed roof is supported by square posts.

Detail Information

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Database (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 34204 18th Place S, Federal Way, is located in King County. According to the county assessor, the structure was built in 1962 and is a single family dwelling. The building has a single-family form with a basement garage.

Historic Property Report

Resource Name: Residence

Property ID: 328435

Significance narrative:

Integrity
From its period of construction (1962), 34204 18th Place S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, and the construction of surrounding heavy commercial development. The building retains integrity of location.
Evaluation
The residential building at 34204 18th Place S was constructed in 1962 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 34204 18th Place S does not retain integrity from its period of construction (1962) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1962, according to the King County Assessor, the residential building at 34204 18th Place S fronts west (King County Assessor 2020). The one-story-on-basement building is U-shaped in plan and is clad in a combination of applied rock veneer and horizontal board siding. The building is topped by a flat roof with eaves clad in an unknown roofing material. On the north side of the (west) facade, a two-car garage dominates the basement level, topped by decorative dentils below the water table and a faux-grid vinyl-framed window on the main level above. All windows are faux-grid, vinyl-framed in altered fenestration. The front door is accessed via a concrete stair with iron railing.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1961), 34213 18th Place S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to alterations to doors, cladding, and other historic-period materials, as well as the heavy commercial construction to the west, north, and east. The building retains integrity of location.

Evaluation

The residential building at 34213 18th Place S was constructed in 1961 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building, as initially constructed, may have embodied the distinctive characteristics of the Ranch style; however, alterations to siding, and other materials have rendered the building unable to convey significance as a representative example of its type (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 34213 18th Place S does not retain integrity from its period of construction (1961) and is not eligible for listing in the National Register of Historic Places (NRHP) or Washington Heritage Register (WHR) under any criteria.

Physical description:

Built in 1961, according to the King County Assessor, the residential building at 34213 18th Place S fronts east (King County Assessor 2020). The one-story, T-shaped building sits on a poured-concrete foundation and is clad in a combination of wood board-and-batten, T1-11, and roman brick veneer on the facade, with horizontal board siding also present on at least the south face. The building features a cross-on-side-gabled roof clad in asphalt/composition roofing. The attached two-car garage projects from the south end of the (east) facade and features a standard (likely fiberglass) door. The facadés entry is sheltered by a shallow porch recessed under the side-gabled roof and supported by square posts. The front door appears to be solid wood, flanked to the south by an aluminum picture window with decorative diamond panes.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1959), 34212 18th Place S retains moderate integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows and fenestration, presumed alterations to cladding based on those alterations, the addition of the deck and enclosure of the garage/storage area, and the construction of surrounding heavy commercial development. The building retains integrity of location.

Evaluation

The residential building at 34212 18th Place S was constructed in 1959 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 34212 18th Place S does not retain integrity from its period of construction (1959) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1959, according to the King County Assessor, the residential building at 34212 18th Place S fronts west (King County Assessor 2020). The one-story, rectangular building sits on a poured-concrete foundation and is clad in horizontal clapboard siding. The building is topped with a front-on-side-gabled roof clad in asphalt roofing. Beneath the wide eaves is unpainted wood. The building features an attached semi-subterranean garage/storage area on the south side of the (west) facade, which is topped by a wood deck. The deck is accessed via vinyl sliding glass doors. All windows on the house are vinyl-framed in altered fenestration. The front door, located off-center beneath the front gable, is a multi-light door protected by a metal screen door. A brick chimney pierces the roof in the center of the house at the ridge of the front gable.

Surveyor Opinion

Significance narrative:

Integrity
From its period of construction (1958), 34221 18th Place S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of historic-period windows, doors, and cladding, and the heavy commercial construction to the west, north, and east. The building retains integrity of location.
Evaluation
The residential building at 34221 18th Place S was constructed in 1958 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building, though constructed with a butterfly roof, a feature often associated with the Contemporary style, does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 34221 18th Place S does not retain integrity from its period of construction (1958) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1958, according to the King County Assessor, the residential building at 34221 18th Place S fronts east (King County Assessor 2020). The one-story building is rectangular in plan, sits on a poured-concrete foundation, and is clad in horizontal clapboard siding (possibly wood or fiber cement). The building is topped by a butterfly roof with wide eaves, clad in an unknown material. All windows appear to be vinyl-framed in altered fenestration. The building is accessed via a concrete stoop on the (east) facade, which features a light-over-panel door protected by a metal screen door.

Surveyor Opinion

Significance narrative:

Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Databas (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description:

The house at 34220 18th Place S, Federal Way, is located in King County. According to the county assessor, the structure was built in 1958 and is a single family dwelling. The building has a single-family form with an attached garage.

Surveyor Opinion

Significance narrative:	Integrity From its period of construction (1958), 34220 18th Place S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered, and the construction of surrounding heavy commercial development. The building retains integrity of location. Evaluation The residential building at 34220 18th Place S was constructed in 1958 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D). Historical Research Associates, Inc. recommends 34220 18th Place S does not retain integrity from its period of construction (1958) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.
Physical description:	Built in 1958, according to the King County Assessor, the residential building at 34220 18th Place S fronts west (King County Assessor 2020). The one-story, rectangular building sits on a poured-concrete foundation and is clad in fiber cement board siding. The building is topped by a side-gabled roof clad in asphalt/composition roofing. Windows throughout are vinyl-framed in altered fenestration. The front door is an unknown material protected by a metal screen door. The garage door appears to be modern with a decorative wood-shingle surround.

Surveyor Opinion

Significance narrative:

Integrity
From its period of construction (1955), 34229 18th Place S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered, and heavy commercial construction to the west. The building retains integrity of location.

Evaluation
The residential building at 34229 18th Place S was constructed in 1955 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 34229 18th Place S does not retain integrity from its period of construction (1955) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1955, according to the King County Assessor, the residential building at 34229 18th Place S fronts east (King County Assessor 2020). The one-story building sits on a poured-concrete foundation and is clad in a combination of T1-11 and plywood siding. The building is topped by a front-gabled roof clad in asphalt/composition roofing. All windows appear to be vinyl-framed in altered fenestration. The (east) facade entry door is a fiberglass door with an arched glass light over four panels. A poured-concrete parking pad is located in front of the facade. The lot slopes east–west on the south side of the house, where the driveway leads to a secondary building located (west) behind the primary building. The secondary building also features a front-gabled roof, T1-11 and plywood siding, and vinyl windows.

Surveyor Opinion

Significance narrative:	Integrity From its period of construction (1954), 34320 Pacific Highway S appears to retain poor integrity of materials, design, workmanship, feeling, and association, due to an apparent loss of all historic-period windows, doors, and cladding, which have been either altered or covered, and the apparent construction of additional attached building massings. The building retains integrity of setting and location. Evaluation The industrial building at 34320 Pacific Highway S was constructed in 1954. Seattle Times articles note that the building was constructed for the Huntington Rubber Co., which manufactured rollers for a paper mill (Seattle Times 1951). It does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D). Historical Research Associates, Inc. recommends 34320 Pacific Highway S does not retain integrity from its period of construction (1954) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.
Physical description:	Built in 1954, according to the King County Assessor, the industrial building at 34320 Pacific Highway S has no front facade, though the parking and employee entrances are located on the north face (King County Assessor 2020). The irregular building has a variety of one- and one-and-a-half story massings, all of which sit on poured-concrete foundations. The connected building massings are clad in standing-seam metal siding. Roof lines vary, including barrel, gable, and shed, all of which are clad in standing-seam metal. Entrances on the north face include vehicular/garage roll-up doors; no pedestrian doors were visible from the right-of-way. The building currently houses Valmet, a company that has been operating in Federal Way since 1931 (Valmet 2020).

SHPO Determination

Detail Information

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Database (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 34235 18th Place S, Federal Way, is located in King County. According to the county assessor, the structure was built in 1955 and is a single family dwelling. The building has a single-family form.

Surveyor Opinion

Significance narrative:

Integrity
From its period of construction (1955), 34235 18th Place S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of historic-period windows, doors, and cladding, which have been either altered or covered, as well as alterations to the garage/carport. The building retains integrity of location.
Evaluation
The residential building at 34235 18th Place S was constructed in 1955 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 34235 18th Place S does not retain integrity from its period of construction (1955) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1955, according to the King County Assessor, the residential building at 34235 18th Place S fronts east (King County Assessor 2020). The one-story, rectangular building sits on a poured-concrete foundation and is clad in a combination of horizontal wood and T1-11 siding. The building is topped by a front-gabled roof clad in an unknown roofing material. On the (east) façade, the building features casement-on-fixed windows of an unknown material (possibly wood) topped by window trim; both windows and trim are unlikely to be original, due to their location within altered siding materials (T1-11). The front door is a (likely fiberglass) arched light over four panel. A chimney pierces the roof at the center of the massing.

A detached shed-roofed building, likely originally constructed as a carport or garage, is located south of the house; the downslope of the house’s gable meets the downslope of the shed roof, creating the illusion of a butterfly roof. The shed building is clad in T1-11 siding and features no doors or windows on elevations visible from the right-of-way.

Detail Information

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Database (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 34234 18th Place S, Federal Way, is located in King County. According to the county assessor, the structure was built in 1957 and is a single family dwelling. The building has a single-family form.

Surveyor Opinion

Significance narrative:

Integrity
From its period of construction (1957), 34234 18th Place S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows and doors, alterations to cladding, the addition of the carport, and the construction of surrounding heavy commercial development. The building retains integrity of location.
Evaluation
The residential building at 34234 18th Place S was constructed in 1957 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 34234 18th Place S does not retain integrity from its period of construction (1957) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1957, according to the King County Assessor, the residential building at 34234 18th Place S fronts west (King County Assessor 2020). The one-story building is L-shaped in plan and sits on a poured-concrete foundation. The building is clad in a combination of horizontal board and T1-11 siding and features a telescoping side-gabled roof clad in asphalt/composition roofing. An attached shed-roofed carport supported by square posts is located on the north face. The building features vinyl-framed windows in altered fenestration, with the primary entry door located beneath the carport on the north face.

Surveyor Opinion

Significance narrative:

Integrity
From its period of construction (1955), 34251 18th Place S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of all historic-period windows, doors, and cladding, and a large extension on the rear that altered the roof and massing. The building retains integrity of location.
Evaluation
The residential building at 34251 18th Place S was constructed in 1955 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 34251 18th Place S does not retain integrity from its period of construction (1955) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1955, according to the King County Assessor, the residential building at 34251 18th Place S fronts east (King County Assessor 2020). The one-story-on-basement building sits on a poured-concrete foundation and is clad in a combination of wood shingle and T1-11 siding. The building features a variety of roof lines clad in asphalt/composition roofing, which are best described as a shed-on-hip, due to a large addition to the rear (west). Windows throughout appear to be altered, including an oriel and a one-by-one wood slider on the front (east) facade. The entry door on the facade is accessed via a curved concrete step to a wood deck, the concrete portion of which may be indicative of a historic-period feature (porch) that is no longer extant.

Detail Information

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Database (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 34250 18th Place S, Federal Way, is located in King County. According to the county assessor, the structure was built in 1955 and is a single family dwelling. The building has a single-family form.

Surveyor Opinion

Significance narrative:

Integrity
From its period of construction (1955), 34250 18th Place S retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of historic-period windows, doors, and cladding, which have been either altered or covered, as well as the enclosure of the garage and the surrounding heavy commercial construction. The building retains integrity of location.
Evaluation
The residential building at 34250 18th Place S was constructed in 1955 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 34250 18th Place S does not retain integrity from its period of construction (1955) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1955, according to the King County Assessor, the residential building at 34250 18th Place S fronts west (King County Assessor 2020). The one-story, rectangular building sits on a poured-concrete foundation and is clad in T1-11 siding. The building is topped by a gable roof clad in asphalt/composition roofing. The building features a dilapidated carport-style shed roof extension on the north face. Adjacent to the carport on the (west) facade, a former attached garage was converted to living space and features a one-by-one slider (either metal or painted vinyl) and a six-panel steel door. The facade also features a combination of slider windows, some that may be original aluminum and others vinyl, in altered fenestration. A decorative diamond detail adorns false shutters that surround the altered vinyl windows.

Surveyor Opinion

Significance narrative:

Integrity
From its period of construction (1966), 34259 18th Place S retains poor integrity of materials, design, workmanship, setting, feeling, and association. While the building retains much of its original materials, including aluminum sash windows and siding on the upper floor, alterations to the rear face have resulted in a change of facade and use. The building retains integrity of location.
Evaluation
The building at 34259 18th Place S was constructed in 1966, likely as a residence, though its use appears to have been converted to commercial. The building does not appear, based on a review of historic maps or local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 34259 18th Place S does not retain integrity from its period of construction (1966) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1966, according to the King County Assessor, the building at 34259 18th Place S was vacant at the time of survey; the building historically fronted east, though the primary entrance appears to have been relocated to the rear (west) face (King County Assessor 2020). The one-story-on-basement, rectangular building sits on a poured-concrete foundation and is clad in horizontal wood clapboard siding. The building features a side-gabled roof clad in asphalt/composition roofing. The building was likely originally constructed as a residence, with the primary (east) facade featuring an off-center recessed door accessed via stairs. Windows on the main (upper) floor were aluminum-framed, both sliders and pictures. However, the building may have been most recently used for a commercial enterprise, as the rear (west) face featured a central glass-light door flanked by banks of commercial-style display or picture windows on the basement level. A second pedestrian entry was located on the north side of the west face.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1959), 1824 S 344th Street retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of windows, doors, cladding, and massing, and commercial construction of a Walmart due south. The building retains integrity of location.

Evaluation

The residential building at 1824 S 344th Street was constructed in 1959 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 1824 S 344th Street does not retain integrity from its period of construction (1959) and is not eligible under any criteria for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1959, according to the King County Assessor, the residential building at 1824 S 344th Street fronts south (King County Assessor 2020). The one-story, rectangular building sits on a poured-concrete foundation and is clad in stucco. The building is topped by a side-gabled roof clad in asphalt/composition roofing. The building features an attached one-car garage on the west side, which appears to be an extension/addition adjacent to an original garage that was converted into living space. The building features modern anodized metal windows and what appear to be aluminum-framed windows, some in altered fenestration. The front door is accessed via a wooden ramp and appears to be a solid wood door protected by a metal screen door.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1947), 1916 S 344th Street retains poor integrity of materials, design, workmanship, setting, feeling, and association, due to a loss of historic-period windows and fenestration patterns, doors, and cladding, the addition of the deck on the east face and associated entry, and the construction of the shed-roofed building to the west. The building retains integrity of location.

Evaluation

The residential building at 1916 S 344th Street was constructed in 1947 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building, as initially constructed, embodied the distinctive characteristics the Minimal Traditional style; however, the loss of integrity leaves the resource unable to convey significance as a representative example of the Minimal Traditional style (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 1916 S 344th Street does not retain sufficient integrity from its period of construction (1947) and is not eligible for listing in the National Register of Historic Places (NRHP) or Washington Heritage Register (WHR) as a representative example of the Minimal Traditional style or under any other criteria for listing in the NRHP or WHR.

Physical description:

Built in 1947, according to the King County Assessor, the residential building at 1916 S 344th Street fronts south (King County Assessor 2020). The one-story, rectangular building sits on a concrete-block foundation and is clad in a combination of horizontal wood and vertical T1-11 siding. The building is topped by a side-gabled roof clad in asphalt/composition roofing. The building features aspects of the Minimal Traditional style, including the minimally ornamented side-gabled massing with a pediment awning over the concrete entrance stoop and stair on the (south) facade. All windows appear to be vinyl in altered fenestration. The entry door is a six-paneled door of unknown material. A deck, accessed via a vinyl sliding-glass door, is located on the east face.

Two associated resources are located on the parcel. The first is a detached shed-roofed building, likely originally constructed as a garage but which appears to have been altered for use as an office or possibly an accessory dwelling unit (ADU). The building features a side-by-side vinyl window and one-light pedestrian door on the south face. The second resource is located behind the shed-roofed building and is only minimally visible from the ROW. The building appears to be an original (ca. 1947) garage or outbuilding, and it features a three-light pedestrian door and at least one aluminum slider window. The building is clad in horizontal board siding, and the roof is clad in asphalt roofing.

Detail Information

Surveyor Opinion

Significance narrative: Data included on this historic property inventory form (HPI) detail stemmed from County Assessor building records imported by the Washington State Department of Archaeology of Historic Preservation (DAHP) into WISAARD in 2011. This upload reduces data entry burden on community volunteers and historical societies participating in the survey and inventory of their communities. The intent of this project is directed specifically to facilitating community and public involvement in stewardship, increasing data accuracy, and providing a versatile planning tool to Certified Local Governments (CLGs).

Project methodology entailed use of the University of Washington's State Parcel Database (http://depts.washington.edu/wagis/projects/parcels/development.php) to provide the base parcel layer for CLGs. Filtering of building data collected from each county trimmed out all properties built after 1969, as well as all current, previously inventoried properties. Translation of building data descriptors to match fields in HPI allowed the data upload. Calculation of point locations utilized the center of each parcel. Data on this detail provides a snapshot of building information as of 2011. A detailed project methodology description resides with DAHP. Project team members: Historic Preservation Northwest, GeoEngineers, and Artifacts Consulting, Inc. (project lead).

Physical description: The house at 1928 S 344th Street, Federal Way, is located in King County. According to the county assessor, the structure was built in 1948 and is a single family dwelling. The building has a single-family form.

Surveyor Opinion

Significance narrative:

Integrity

From its period of construction (1948), 1928 S 344th Street retains poor integrity of materials, design, workmanship, association, and feeling, due to a loss of all historic-period windows, doors, and cladding, which have been either altered or covered. The building retains integrity of location and setting.

Evaluation

The commercial building at 1928 S 344th Street was constructed in 1948 and does not appear, based on a review of historic maps and local histories, to have any association with events that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not reveal any association of the resource with the lives of significant persons (Criterion B). The building does not embody the distinctive characteristics of a type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., is part of a district) (Criterion C). Finally, the building was built of common construction methods and well-known materials and is unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Historical Research Associates, Inc. recommends 1928 S 344th Street does not retain integrity from its period of construction (1948) and is not eligible for listing in the National Register of Historic Places or Washington Heritage Register.

Physical description:

Built in 1948, according to the King County Assessor, the commercial building at 1928 S 344th Street fronts south (King County Assessor 2020). The one-story, rectangular building sits on a poured-concrete foundation and is clad in a combination of plywood with batten siding in the facade (south) gable and what appears to be parged or painted concrete masonry units or possibly brick. The building is topped by a front-gabled roof clad in asphalt/composition material. The building, which currently houses Gene’s Towing, features a recessed entry on the facade, supported by square posts. All visible windows are vinyl-framed; the one visible door appears to be steel.

Surveyor Opinion

Significance narrative: Integrity

From its period of construction (1974), the commercial building and outbuilding at 34703 16th Avenue S retain integrity of location, setting, feeling, and association, although alterations, including window replacement and altered fenestration, have diminished the primary building's integrity of design, materials, and workmanship.

Evaluation

The commercial buildings at 34703 16th Avenue S were constructed in 1974. They do not appear, based on a review of historic maps and local histories, to hold any historic-period associations with important events or trends that made a significant contribution to the broad patterns of local, state, or national history (Criterion A). Background research did not suggest that the building held a strong association with the lives of significant persons (Criterion B). The buildings are common prefabricated metal warehouses, utilitarian in style, with no architectural significance (Criterion C). They do not embody the distinctive characteristics of a particular type, period, or method of construction; or represent the work of a master; or possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction (i.e., contribute to an existing or potential historic district). Finally, the buildings were constructed of common methods and well-known materials and are unlikely to answer important research questions or yield information about human history that can only be answered by the actual physical material, design, construction methods, or interrelation of these resources (Criterion D).

Due to a lack of significance and integrity, Historical Research Associates, Inc. recommends that the commercial building and associated warehouse at 34703 16th Avenue S are not eligible for listing in the National Register of Historic Places under any criteria.

Physical description: Built in 1974, the commercial building at 34703 16th Avenue S fronts north (King County Assessor 2020). The one-story building sits on a poured-concrete foundation, is clad in ribbed metal panels, and is topped by a front-gabled metal roof with a shallow peak. Full-height, metal-framed storefront windows appear in banks of three in altered fenestration on the east elevation and on the north facade where the main entrance consists of a commercial glass door flanked by full-height windows. Five garage bays are located on the north facade west of a chain-link property gate. A secondary detached warehouse building sits west of the main building. It is one-and-one-half stories tall, sits on a poured-concrete foundation, is clad in corrugated metal, and is topped by a front-gabled metal roof.

image001.jpg

Good morning –

Attached is a cultural resources survey plan for Sound Transit’s proposed Operations and Maintenance Facility – South (OMFS) Project. This project is currently in environmental review and Sound Transit is preparing a SEPA EIS. No federal funding is planned. If a federal approval or permit is determined to be needed later, appropriate NEPA and Section 106 documentation will be completed. The OMFS facility will support expanded light rail service resulting from the entire ST3 program in King and Pierce counties.

Currently, there are three alternative locations for the facility with associated rail guideway: the Midway Landfill in the City of Kent, and two sites in the City of Federal Way. There is no preferred alternative at this time. With the two Federal Way site alternatives, about a mile of future guideway track from the terminus of Federal Way Link Extension southward to connect the two sites would also function as a portion of the future guideway for the Tacoma Dome Link Extension project (TDLE), which extends light rail from Federal Way to Tacoma. Sound Transit coordinated with the Federal Transit Administration (FTA), which is the lead federal agency for TDLE, to confirm OMFS and TDLE have independent utility. As a result, they are being evaluated in separate EISs. It is important that the OMFS and TDLE projects be considered separate for environmental review and permitting purposes because of their differing regulatory frameworks and associated environmental requirements.

We are sending this document to you for your review and kindly request comments on the document within 30 days of its receipt. We anticipate starting cultural resources fieldwork described in this document on February 10, 2019. We will notify you of our official start date for fieldwork and invite you to visit or monitor the work at that time.

We appreciate your review and look forward to answering any comments or questions you may have on this project. Please email Alex Stevenson, Sound Transit’s Cultural Resources Program Manager at alex.stevenson@soundtransit.org or contact Alex by phone at 206-553-3655.

Property: Sound Transit Operations and Maintenance Facility South (OMFS)
Re: No Effect to Historic Properties

Dear Mr. Stevenson:

Thank you for contacting the Department of Archaeology and Historic Preservation (DAHP) and providing a copy of the cultural resources survey report for the above referenced project. First, we agree that Sites 45KI1542 and 45KI1543 are NOT ELIGIBLE for inclusion in the National Register of Historic Places (NRHP). We also agree that the 60 properties identified and recorded for this project are NOT ELIGIBLE for inclusion in the NRHP. Finally, we agree with the recommendations made in the report and your finding of No Effect to Historic Properties. As a result of our agreement, further contact with DAHP on this matter is not necessary.

However, if information becomes available and/or the scope of work changes, please resume consultation with DAHP and all consulting parties. In the event that archaeological or historic materials are discovered during project activities, work in the immediate vicinity must stop, the area secured, and contact made with concerned tribes and DAHP for further consultation.

These comments are based on the information available at the time of this review and on behalf of the State Historic Preservation Officer in conformance with Washington State law.

Thank you for the opportunity to review and comment. If you have any questions, please feel free to contact me.

Sincerely,

Dennis Wardlaw

Property: King County_ Sound Transit Line Raises Project
Re: NO Adverse Effect

Dear Ms. Clark Schmidt:

Thank you for contacting the State Historic Preservation Officer (SHPO) and Department of Archaeology and Historic Preservation (DAHP) regarding the above referenced proposal. This action has been reviewed on behalf of the SHPO under provisions of Section 106 of the National Historic Preservation Act of 1966 (as amended) and 36 CFR Part 800. Our review is based upon documentation contained in your communication.

We concur that the current project as proposed will have "NO ADVERSE EFFECT" on historic properties within the APE that are listed in, or determined eligible for listing in, the National Register of Historic Places. As a result of our concurrence, further contact with DAHP on this proposal is not necessary.

However, if new information about affected resources becomes available and/or the project scope of work changes significantly, please resume consultation as our assessment may be revised. Also, if any archaeological resources are uncovered during construction, please halt work immediately in the area of discovery and contact the appropriate Native American Tribes and DAHP for further consultation.

Thank you for the opportunity to review and comment. If you have any questions, please feel free to contact me.

Sincerely,

Dennis Wardlaw
Transportation Archaeologist

The Honorable Jaison Elkins
Chairman
Muckleshoot Indian Tribe
39015 172nd Avenue SE
Auburn, Washington 98092

Subject: Sound Transit
Operations and Maintenance Facility South Project
National Historic Preservation Act, Section 106
Consultation Initiation

Dear Chairman Elkins:

The Federal Transit Administration (FTA), in cooperation with Sound Transit, is proposing the Operations and Maintenance Facility (OMF) South Project (the Project). Sound Transit intends to apply for federal funds administered by FTA for the Project, making it an undertaking subject to the provisions of Section 106 of the National Historic Preservation Act (Section 106), and its implementing regulations at 36 Code of Federal Regulations (CFR) Part 800. This letter initiates Section 106 consultation with your tribe, and requests feedback on the proposed Area of Potential Effects (APE).

The Project would provide a facility in the South Corridor of Sound Transit 3 (ST3), Sound Transit’s regional system plan, to receive, test, commission, store, maintain, and deploy vehicles for the system-wide light rail expansion. Alternatives being evaluated include a No-Build alternative, the South 336th Street alternative (Preferred Alternative), the South 344th Street alternative, and the Midway Landfill alternative. The Preferred and South 344th Street alternatives are in Sections 16 and 21 of Township 21 North, Range 4 East. The Midway Landfill alternative is in Sections 21 and 22 of Township 22 North, Range 4 East.

The build alternatives range in size from approximately 65 to 70 acres in the cities of Federal Way and Kent. Each alternative includes tracks connecting the OMF to the Federal Way Link Extension light rail line that will be operating when the OMF South is planned to open. The length and location of these connecting tracks varies by alternative.

The proposed APE is shown in the enclosed map set. The proposed APE generally extends from elements of the Project alternatives (e.g., guideway, station locations, and construction staging areas) to the nearest tax parcel or a maximum of 200 feet where large tax parcels are adjacent to Project elements.

Pursuant to 36 CFR Part 800, FTA respectfully requests your comments on the APE within 30 days of receipt of this letter. Should you require additional information or have questions, please contact Justin Zweifel at (206) 220-7538 or justin.zweifel@dot.gov.

FTA has also sent you a separate letter inviting you to participate in the environmental review process under the National Environmental Policy Act (NEPA) as participating agency.

Thank you for your consultation on the Project.

Sincerely,

SUSAN KAY

Allyson Brooks, Ph.D.
State Historic Preservation Officer
Washington Department of Archaeology and Historic Preservation
P.O. Box 48343
Olympia, WA 98504-8343

Subject: Sound Transit
Operations and Maintenance Facility South Project
National Historic Preservation Act, Section 106
Consultation Initiation

Dear Dr. Brooks:

The Federal Transit Administration (FTA), in cooperation with Sound Transit, is proposing the Operations and Maintenance Facility (OMF) South Project (the Project). Sound Transit intends to apply for federal funds administered by FTA for the Project, making it an undertaking subject to the provisions of Section 106 of the National Historic Preservation Act (Section 106), and its implementing regulations at 36 Code of Federal Regulations (CFR) Part 800. This letter initiates Section 106 consultation with the Washington State Historic Preservation Officer (SHPO), and requests feedback on the proposed Area of Potential Effects (APE).

The Project would provide a facility in the South Corridor of Sound Transit 3 (ST3), Sound Transit’s regional system plan, to receive, test, commission, store, maintain, and deploy vehicles for the system-wide light rail expansion. Alternatives being evaluated include a No-Build alternative, the South 336th Street alternative (Preferred Alternative), the South 344th Street alternative, and the Midway Landfill alternative. The Preferred and South 344th Street alternatives are in Sections 16 and 21 of Township 21 North, Range 4 East. The Midway Landfill alternative is in Sections 21 and 22 of Township 22 North, Range 4 East.

The build alternatives range in size from approximately 65 to 70 acres in the cities of Federal Way and Kent. Each alternative includes tracks connecting the OMF to the Federal Way Link Extension light rail line that will be operating when the OMF South is planned to open. The length and location of these connecting tracks varies by alternative.

The proposed APE is shown in the enclosed map set. The proposed APE generally extends from elements of the Project alternatives (e.g., guideway, station locations, and construction staging areas) to the nearest tax parcel or a maximum of 200 feet where large tax parcels are adjacent to Project elements. Prior to federalizing the Project, Sound Transit consulted with your office on the project, built environment resources, and archaeological resources (**DAHP Log # 2020-02-01045**). The proposed APE is consistent with the area of impacts identified through that earlier consultation. However, the Project will now comply with the relevant federal statutes and regulations required for NEPA, including Section 106.

FTA will contact the following tribes to notify them of the undertaking, initiate Section 106 consultation, and request their comments: Confederated Tribes and Bands of the Yakama Nation; Muckleshoot Indian Tribe; Nisqually Indian Tribe; Puyallup Tribe of Indians; Snoqualmie Indian Tribe; Squaxin Island Tribe of the Squaxin Island Reservation; and the Suquamish Indian Tribe of the Port Madison Reservation. FTA looks forward to responding to any concerns these tribes may identify and will notify you of any such concerns.

Pursuant to 36 CFR Part 800, FTA respectfully requests your comments on the APE within 30 days of receipt of this letter. Should you require additional information or have questions, please contact Justin Zweifel at (206) 220-7538 or justin.zweifel@dot.gov.

FTA has also sent you a separate letter inviting you to participate in the environmental review process under the National Environmental Policy Act (NEPA) as participating agency.

Thank you for your consultation on the Project.

Sincerely,

Re: Archaeology - APE Concur

Dear Susan Kay Fletcher:

Thank you for contacting the State Historic Preservation Officer (SHPO) and Department of Archaeology and Historic Preservation (DAHP) regarding the above referenced project. In response, we have reviewed your description and map of the area of potential effect (APE).

We concur with your definition of the APE. Please provide us with your survey methodology before proceeding with any inventories. Along with the results of the inventory we will need to review your consultation with the concerned tribes, and other interested/affected parties. Please provide any correspondence or comments from concerned tribes and/or other parties that you receive as you consult under the requirements of 36 CFR 800.4(a)(4).

These comments are based on the information available at the time of this review and on behalf of the SHPO in conformance with Section 106 of the National Historic Preservation Act and its implementing regulations 36 CFR 800. Should additional information about the project become available, our assessment may be revised.

Thank you for the opportunity to review and comment. Please ensure that the DAHP Project Number (a.k.a. Project Tracking Code) is shared with any hired cultural resource consultants and is attached to any communications or submitted reports. If you have any questions, please feel free to contact me.

Sincerely,

Re: Sound Transit Operations and Maintenance Facility South Project

The Nisqually Indian Tribe's THPO has reviewed the Section 106 consultation letter and supplemental materials that you provided for the above-named project and has no specific comments or concerns regarding the four build options. Please keep us informed if there are any Inadvertent Discoveries of Archaeological Resources/Human Burials.

Although the Nisqually Indian Tribe doesn't have any specific concerns at this time, we respect the traditional cultural knowledge of affected tribes and support their opinions on this matter as well.

Sincerely,

Brad Beach, THPO

The Honorable Jaison Elkins
Chairman
Muckleshoot Indian Tribe
39015 172nd Avenue SE
Auburn, Washington 98092

SUBJECT: **Sound Transit**
Operations and Maintenance Facility South Project
National Historic Preservation Act, Section 106
Eligibility and Effects Determination

Dear Chairman Elkins:

The Federal Transit Administration (FTA), in cooperation with Sound Transit, is continuing consultation under Section 106 of the National Historic Preservation Act (Section 106) and its implementing regulations at 36 CFR Part 800 for the Sound Transit Operations and Maintenance Facility (OMF) South Project (the Project). The Project would provide a facility in the South Corridor of Sound Transit 3, Sound Transit's regional system plan, to receive, test, commission, store, maintain, and deploy vehicles for the system-wide light rail expansion. This letter requests your feedback on the proposed Eligibility and Effects Determinations for the Project.

Cultural Resources Evaluation

In 2020, prior to federalizing the project, Sound Transit consulted with the Washington State Historic Preservation Officer (SHPO) on the project, area of impact, built environment resources, and archaeological resources. Through that analysis and consultation, on January 20, 2021, it was determined no buildings, structures, or objects were eligible for listing in the National Register of Historic Places (NRHP) and that the Project would result in no adverse effects to historic properties. On July 20, 2023, FTA initiated consultation with your tribe and defined the area of potential effects (APE) for the Project. The FTA-defined APE is consistent with the area of impacts analyzed by Sound Transit during their initial Washington State Environmental Policy Act environmental review, and includes the same archaeological sites, buildings, structures, and objects that Sound Transit consulted with the SHPO on in 2020.

To support the evaluation of the Project, Sound Transit's consultant, Historical Research Associates Inc. (HRA) prepared *OMF South Appendix G4: Historic and Archaeological Resources Technical Report, dated September 2023* (Cultural Resources Report). The Cultural Resources Report is enclosed.
In summary, there are three archaeological resources within the APE – each of these has been previously determined by the SHPO to be not eligible for listing in the NRHP. There are 60 buildings, structures, and objects that meet the minimum age criteria for listing in the National Register of Historic Places within the

APE[1]. Sound Transit's consultant, HRA, surveyed 58 of these resources and in correspondence with SHPO to Sound Transit, dated January 20, 2021, these resources were determined not eligible for listing in the NRHP[2].

The remaining two historic-era structures consist of double circuit transmission lines: Tacoma-Covington No. 2, 3, 4 and Tacoma-Raver No. 1. These structures are owned and operated by Bonneville Power Administration (BPA) and cross the APE. To accommodate elevated track associated with the Project's Preferred and South 344th Street alternatives, BPA would need to relocate and rebuild the following structures: structures 6/5 and 6/6 on the Tacoma-Raver No. 1 and the Tacoma-Covington No 2. Transmission Line, and structures 6/5 and 6/6 on the Tacoma-Covington No. 3 and No. 4 Transmission Line. On August 9, 2021, BPA determined that these structures are eligible for listing in the NRHP under Criterion A but that the modifications discussed above result in no adverse effect to historic properties. On August 19, 2021, SHPO concurred with this determination of no adverse effect to historic properties. This correspondence is enclosed for your records, titled *Cultural Resources Letter Report for the Sound Transit Line Raises Project*.

Determinations

Based on the aforementioned documentation, FTA has made the following determinations:

- There are two resources – BPA's historic-era double circuit transmission lines – that are listed on, or eligible for the NRHP within the APE.
- The Project would have **no adverse effect** on resources listed on, or eligible for, the NRHP.

Request for Comments

Pursuant to 36 CFR Part 800, FTA respectfully requests any comments you may have on these determinations within 30 days of receipt of this letter. If you have any questions, please contact Justin Zweifel at justin.zweifel@dot.gov.

To accommodate elevated track associated with the Project's Preferred and South 344th Street alternatives, BPA would need to relocate and rebuild the following structures: structures 6/5 and 6/6 on the Tacoma-Raver No. 1 and the Tacoma-Covington No 2. Transmission Line, and structures 6/5 and 6/6 on the Tacoma-Covington No. 3 and No. 4 Transmission Line. On August 9, 2021, BPA determined that these structures are eligible for listing in the NRHP under Criterion A but that the modifications discussed above result in no adverse effect to historic properties. On August 19, 2021, SHPO concurred with this determination of no adverse effect to historic properties. This correspondence is enclosed for your records, titled *Cultural Resources Letter Report for the Sound Transit Line Raises Project*.

Determinations

Based on the aforementioned documentation, FTA has made the following determinations:

- There are two resources – BPA's historic-era double circuit transmission lines – that are listed on, or eligible for the NRHP within the APE.
- The Project would have **no adverse effect** on resources listed on, or eligible for, the NRHP.

Request for Comments

Pursuant to 36 CFR Part 800, FTA respectfully requests any comments you may have on these determinations within 30 days of receipt of this letter. If you have any questions, please contact Justin Zweifel at justin.zweifel@dot.gov.

Sincerely,

SUSAN KAY FLETCHER

The Honorable Leonard Forsman
Chairman
Suquamish Indian Tribe of the Port Madison Reservation
PO Box 498
Suquamish, Washington 98392

SUBJECT: **Sound Transit**
Operations and Maintenance Facility South Project
National Historic Preservation Act, Section 106
Eligibility and Effects Determination

Dear Chairman Forsman:

The Federal Transit Administration (FTA), in cooperation with Sound Transit, is continuing consultation under Section 106 of the National Historic Preservation Act (Section 106) and its implementing regulations at 36 CFR Part 800 for the Sound Transit Operations and Maintenance Facility (OMF) South Project (the Project). The Project would provide a facility in the South Corridor of Sound Transit 3, Sound Transit's regional system plan, to receive, test, commission, store, maintain, and deploy vehicles for the system-wide light rail expansion. This letter requests your feedback on the proposed Eligibility and Effects Determinations for the Project.

Cultural Resources Evaluation

In 2020, prior to federalizing the project, Sound Transit consulted with the Washington State Historic Preservation Officer (SHPO) on the project, area of impact, built environment resources, and archaeological resources. Through that analysis and consultation, on January 20, 2021, it was determined no buildings, structures, or objects were eligible for listing in the National Register of Historic Places (NRHP) and that the Project would result in no adverse effects to historic properties. On July 20, 2023, FTA initiated consultation with your tribe and defined the area of potential effects (APE) for the Project. The FTA-defined APE is consistent with the area of impacts analyzed by Sound Transit during their initial Washington State Environmental Policy Act environmental review, and includes the same archaeological sites, buildings, structures, and objects that Sound Transit consulted with the SHPO on in 2020.

To support the evaluation of the Project, Sound Transit's consultant, Historical Research Associates Inc. (HRA) prepared *OMF South Appendix G4: Historic and Archaeological Resources Technical Report, dated September 2023* (Cultural Resources Report). The Cultural Resources Report is enclosed.
In summary, there are three archaeological resources within the APE – each of these has been previously determined by the SHPO to be not eligible for listing in the NRHP. There are 60 buildings, structures, and objects that meet the minimum age criteria for listing in the National Register of Historic Places within the

APE[1]. Sound Transit's consultant, HRA, surveyed 58 of these resources and in correspondence with SHPO to Sound Transit, dated January 20, 2021, these resources were determined not eligible for listing in the NRHP[2].

The remaining two historic-era structures consist of double circuit transmission lines: Tacoma-Covington No. 2, 3, 4 and Tacoma-Raver No. 1. These structures are owned and operated by Bonneville Power Administration (BPA) and cross the APE. To accommodate elevated track associated with the Project's Preferred and South 344th Street alternatives, BPA would need to relocate and rebuild the following structures: structures 6/5 and 6/6 on the Tacoma-Raver No. 1 and the Tacoma-Covington No 2. Transmission Line, and structures 6/5 and 6/6 on the Tacoma-Covington No. 3 and No. 4 Transmission Line. On August 9, 2021, BPA determined that these structures are eligible for listing in the NRHP under Criterion A but that the modifications discussed above result in no adverse effect to historic properties. On August 19, 2021, SHPO concurred with this determination of no adverse effect to historic properties. This correspondence is enclosed for your records, titled *Cultural Resources Letter Report for the Sound Transit Line Raises Project*.

Determinations

Based on the aforementioned documentation, FTA has made the following determinations:

- There are two resources – BPA's historic-era double circuit transmission lines – that are listed on, or eligible for the NRHP within the APE.
- The Project would have **no adverse effect** on resources listed on, or eligible for, the NRHP.

Request for Comments

Pursuant to 36 CFR Part 800, FTA respectfully requests any comments you may have on these determinations within 30 days of receipt of this letter. If you have any questions, please contact Justin Zweifel at justin.zweifel@dot.gov.

Sincerely,

SUSAN KAY FLETCHER

Sunshine Clark Schmidt
Federal Preservation Officer and Cultural Resources Program Director
Bonneville Power Administration
PO Box 3621
Portland, OR 97208

SUBJECT: Sound Transit
Operations and Maintenance Facility South Project
National Historic Preservation Act, Section 106
Eligibility and Effects Determination

Dear Ms. Schmidt:

The Federal Transit Administration (FTA), in cooperation with Sound Transit, is preparing an Environmental Impact Statement (EIS) for the Operations and Maintenance Facility (OMF) South Project (Project). Sound Transit intends to apply for federal funds administered by FTA for the Project, making it an undertaking subject to the provisions of Section 106 of the National Historic Preservation Act (Section 106), and its implementing regulations at 36 CFR Part 800. This letter identifies BPA as a Section 106 consulting party and requests your feedback on the area of potential effects (APE) and eligibility and effects determinations for the Project. This letter also notifies BPA of FTA's intent to make a *de minimis* impact determination under Section 4(f) of the U.S. Department of Transportation Act, as described in detail below.

Consulting Party

FTA has determined that BPA meets the criteria outlined in 36 CFR Part 800 to be defined as a consulting party with "interest in the effects of the undertaking on historic properties" because portions of transmission lines owned and operated by BPA are located within the APE. As a consulting party, you are receiving information about historic properties within the APE, including potential effects to properties in which you may have an interest.

Cultural Resources Evaluation

In 2020, prior to federalizing the project, Sound Transit consulted with the Washington State Historic Preservation Officer (SHPO) on the project, area of impact, built environment resources, and archaeological resources. Through that analysis and consultation, on January 20, 2021, it was determined no buildings, structures, or objects were eligible for listing in the National Register of Historic Places (NRHP) and that the Project would result in no adverse effects to historic properties. The FTA-defined APE (enclosed) is consistent with the area of impacts analyzed by Sound Transit during their initial Washington State Environmental Policy Act environmental review, and includes the same archaeological sites, buildings, structures, and objects that Sound Transit consulted with the SHPO on in 2020.

In summary, there are three archaeological resources within the APE – each of these has been previously determined by SHPO to be not eligible for listing in the NRHP. There are 60 buildings, structures, and objects that meet the minimum age criteria for listing in the National Register of Historic Places within the APE[1]. Sound Transit's consultant, HRA, surveyed 58 of these resources and in correspondence from SHPO to Sound Transit, dated January 20, 2021, these resources were determined not eligible for listing in the NRHP[2].

The remaining two historic-era structures consist of double circuit transmission lines: Tacoma-Covington No. 2, 3, 4 and Tacoma-Raver No. 1. These structures are owned and operated by BPA and cross the APE. To accommodate elevated track associated with the Project's Preferred and South 344th Street alternatives, BPA would need to relocate and rebuild the following structures: structures 6/5 and 6/6 on the Tacoma-Raver No. 1 and the Tacoma-Covington No 2. Transmission Line, and structures 6/5 and 6/6 on the Tacoma-Covington No. 3 and No. 4 Transmission Line. On August 9, 2021, BPA determined that these structures are eligible for listing in the NRHP under Criterion A but that the modifications discussed above result in no adverse effect to historic properties. On August 19, 2021, SHPO concurred with this determination of no adverse effect to historic properties. This correspondence is enclosed for your records, titled *Cultural Resources Letter Report for the Sound Transit Line Raises Project* (DAHP Log No. 2020-12-07557).

Section 4(f) Coordination

In the case of historic properties subject to Section 4(f), pursuant to the implementing regulations at 23 CFR Part 774, the SHPO is an official with jurisdiction. Accordingly, FTA is contacting SHPO separately to coordinate on the Project's use of BPA's double circuit transmission lines, a historic resource protected by Section 4(f). FTA is considering making a determination that the Project's use of BPA's double circuit transmission lines meets the Section 4(f) *de minimis* Impact provision.

Under 23 CFR § 774.5(b), prior to making a *de minimis* impact determination, FTA must obtain SHPO's concurrence in a finding of "no adverse effect" under 36 CFR Part 800. Accordingly, FTA is requesting SHPO concurrence with the Section 106 no adverse effect determination so FTA can make a d*e minimis* impact determination under Section 4(f) for the use of BPA's double circuit transmission lines.

This letter notifies BPA of FTA's intent to use SHPO's written concurrence with the Section 106 no adverse effect determination for BPA's double circuit transmission lines to reach a Section 4(f) *de minimis* use determination.

---

[1] Minimum age for NRHP eligibility is defined in this consultation as 50 years from the anticipated start of construction, 2025. These resources are included in Table G4.6-1 of the enclosed Cultural Resources Report.

[2] *Sound Transit SEPA Eligibility and Effects Consultation Materials* is enclosed for your records.

Determinations

Based on the aforementioned documentation, FTA has made the following determinations:

- There are two resources – BPA's historic-era double circuit transmission lines – that are listed on, or eligible for the NRHP within the APE.
- The Project would have **no adverse effect** on resources listed on, or eligible for, the NRHP.
- The Project's use of BPA's double circuit transmission lines meets the Section 4(f) *de minimis* Impact provision.

Request for Comments

Pursuant to 36 CFR Part 800, FTA respectfully requests any comments you may have with the Section 106 determinations within 30 days of receipt of this letter. If you have any questions, please contact Justin Zweifel at justin.zweifel@dot.gov.

Sincerely,

October 27, 2023

Allyson Brooks, Ph.D.
State Historic Preservation Officer
Washington Department of Archaeology and Historic Preservation
P.O. Box 48343
Olympia, WA 98504

SUBJECT: Sound Transit
Operations and Maintenance Facility South Project
National Historic Preservation Act, Section 106
Eligibility and Effects Determination
Project Tracking Code: 2020-02-01045

Dear Dr. Brooks:

The Federal Transit Administration (FTA), in cooperation with Sound Transit, is continuing consultation under Section 106 of the National Historic Preservation Act (Section 106) and its implementing regulations at 36 CFR Part 800 for the Sound Transit Operations and Maintenance Facility (OMF) South Project (the Project). FTA is also coordinating with SHPO under Section 4(f) of the Department of Transportation Act of 1966 (Section 4(f)). The Project would provide a facility in the South Corridor of Sound Transit 3, Sound Transit's regional system plan, to receive, test, commission, store, maintain, and deploy vehicles for the system-wide light rail expansion. **This letter requests your concurrence with the proposed Eligibility and Effects Determinations for the Project.**

On July 20, 2023, in consultation with your office, the FTA defined the area of potential effects (APE) for the Project. In correspondence dated July 24, 2023, your office agreed with the defined APE and requested survey methodology and review of FTA's consultation with concerned Tribes and other interested/affected parties. To support the evaluation of the Project, Sound Transit's consultant, Historical Research Associates Inc. (HRA) prepared *OMF South Appendix G4: Historic and Archaeological Resources Technical Report, dated September 2023* (Cultural Resources Report). The Cultural Resources Report is enclosed for your review.

Survey Methodology and Consultation Record

We appreciate your interest in the Project survey methodology. The Cultural Resources Report includes the archaeological and built environment survey methods in Section 5, pages G4-43 through G4-46. Additionally, we have enclosed responses received from affected Tribes. Your office was carbon copied, via email, on all initial correspondence with Tribes, which included the Confederated Tribes and Bands of the Yakama Nation, Muckleshoot Indian Tribe, Nisqually Indian Tribe, Puyallup Tribe of Indians, Snoqualmie Indian Tribe, Squaxin Island Tribe of the Squaxin Island Reservation, and the Suquamish Indian Tribe of the Port Madison Reservation. We received responses from the Nisqually Indian Tribe, Squaxin Island Tribe of the Squaxin Island Reservation, and the Suquamish Indian Tribe of the Port Madison Reservation.

Cultural Resources Evaluation

As noted in our July 20, 2023 consultation, prior to federalizing the Project, Sound Transit consulted with your office on the Project, built environment resources, and archaeological resources. The FTA-defined APE is consistent with the area of impacts analyzed by Sound Transit during their initial Washington State Environmental Policy Act environmental review, and includes the same archaeological sites, buildings, structures, and objects that Sound Transit consulted with your office on in 2020 (DAHP Log # 2020-02-01045). Through that analysis and consultation, on January 20, 2021, it was determined no buildings, structures, or objects were eligible for listing in the National Register of Historic Places (NRHP) and that the Project would result in no adverse effects to historic properties.

In summary, there are three archaeological resources within the APE – each of these has been previously determined by your office to be not eligible for listing in the NRHP. There are 60 buildings, structures, and objects that meet the minimum age criteria for listing in the National Register of Historic Places within the APE[1]. Sound Transit's consultant, HRA, surveyed 58 of these resources and in correspondence from your office to Sound Transit, dated January 20, 2021, these resources were determined not eligible for listing in the NRHP[2].

The remaining two historic-era structures consist of double circuit transmission lines: Tacoma-Covington No. 2, 3, 4 and Tacoma-Raver No. 1. These structures are owned and operated by Bonneville Power Administration (BPA) and cross the APE. To accommodate elevated track associated with the Project's Preferred and South 344th Street alternatives, BPA would need to relocate and rebuild the following structures: structures 6/5 and 6/6 on the Tacoma-Raver No. 1 and the Tacoma-Covington No 2. Transmission Line, and structures 6/5 and 6/6 on the Tacoma-Covington No. 3 and No. 4 Transmission Line. On August 9, 2021, BPA determined that these structures are eligible for listing in the NRHP under Criterion A but that the modifications discussed above result in no adverse effect to historic properties. On August 19, 2021, your office concurred with this determination of no adverse effect to historic properties. This correspondence is enclosed for your records, titled *Cultural Resources Letter Report for the Sound Transit Line Raises Project* (DAHP Log No. 2020-12-07557).

Section 4(f) Coordination

In the case of historic properties subject to Section 4(f), pursuant to the implementing regulations at 23 CFR Part 774, the SHPO is an official with jurisdiction. Accordingly, FTA is also contacting SHPO to coordinate on the Project's use of BPA's double circuit transmission lines, a historic resource protected by Section 4(f). FTA is considering making a determination that the Project's use of BPA's double circuit transmission lines meets the Section 4(f) *de minimis* Impact provision.

Under 23 CFR § 774.5(b), prior to making a *de minimis* impact determination, FTA must obtain SHPO's concurrence in a finding of "no adverse effect" under 36 CFR Part 800. Accordingly, FTA requests SHPO concurrence with the Section 106 no adverse effect determination so FTA can make a d*e minimis* impact determination under Section 4(f) for the use of BPA's double circuit transmission lines.

---

[1] Minimum age for NRHP eligibility is defined in this consultation as 50 years from the anticipated start of construction, 2025. These resources are included in Table G4.6-1 of the enclosed Cultural Resources Report.

[2] *Sound Transit SEPA Eligibility and Effects Consultation Materials* is enclosed for your records.

This letter serves as the required notification of FTA's intent to use SHPO's written concurrence with the Section 106 no adverse effect determination for BPA's double circuit transmission lines to reach a Section 4(f) *de minimis* use determination.

Determinations

Based on the aforementioned documentation, FTA has made the following determinations:

- There are two resources – BPA's historic-era double circuit transmission lines – that are listed on, or eligible for the NRHP within the APE.
- The Project would have **no adverse effect** on resources listed on, or eligible for, the NRHP.
- The Project's use of BPA's double circuit transmission lines meets the Section 4(f) *de minimis* Impact provision.

Request for Concurrence

Pursuant to 36 CFR Part 800, FTA requests your concurrence with the Section 106 determinations within 30 days of receipt of this letter.

If FTA can provide assistance or additional information which would aid in your prompt reply, please contact Justin Zweifel at FTA (206) 220-7538 or justin.zweifel@dot.gov.

Sincerely,

Re: No Adverse Effect

Dear Ms. Fletcher:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP) regarding the above referenced proposal. This action has been reviewed on behalf of the State Historic Preservation Officer (SHPO) under provisions of Section 106 of the National Historic Preservation Act of 1966 (as amended) and 36 CFR Part 800. Our review is based upon documentation contained in your communication.

We concur that the project as proposed will have no adverse effect on resources listed in, or eligible for listing in, the National Register of Historic Places. As a result of our concurrence, further contact with DAHP on this proposal is not necessary. We also acknowledge your Section 4(f) *de minimis* determination.

If new information about affected resources becomes available and/or the project scope of work changes significantly, please resume consultation as our assessment may be revised. Also, if any archaeological resources are uncovered during construction, please halt work immediately in the area of discovery and contact the appropriate Native American Tribes and DAHP for further consultation.

Thank you for the opportunity to review and comment. If you have any questions, please feel free to contact me.

Sincerely,

Dennis Wardlaw

Subject: [EXTERNAL] Sound Transit Operations and Maintenance Facility South Project - NHPA Section 106 Eligibility and Effects Consultation

Dear Chairman Forsman:

Please see the attached Section 106 Eligibility and Effects Consultation letter for the Sound Transit Operations and Maintenance Facility South Project.

I will send you, separately, a secure link to download the cultural resources report (Enclosure 1) because it is too large to email. Please let me know if you have any issues or questions.

Thank you,

Justin Zweifel (he/him)
Acting Director, Office of Planning and Program Development

Inadvertent Discovery Plan

Operation and Maintenance Facility South

1 Introduction

This Inadvertent Discovery Plan (IDP) has been developed by Sound Transit (ST) for use during ground-disturbing activities for the Operation and Maintenance Facility (OMF) South. This IDP describes the protocols to be followed by personnel working on the OMF South project if archaeological resources are discovered during ground-disturbing activities.

1.1 Project Description

Sound Transit proposes to construct and operate an operations and maintenance facility in its South Corridor (OMF South) to meet agency needs for an expanded fleet of light rail vehicles (LRVs). The need to expand LRV maintenance capacity was identified in Sound Transit 3: The Regional Transit System Plan for Central Puget Sound (Sound Transit 3). OMF South would be used to store, maintain, and deploy a minimum of 160 LRVs for daily service. It would provide facilities for vehicle storage, inspections, maintenance and repair, interior vehicle cleaning, and exterior vehicle washing. Additionally, the facility would receive, test, and commission new LRVs for the entire light rail system.

OMF South would also be used to accommodate administrative and operational functions, such as serving as a report base for LRV operators. Included is a Maintenance of Way (MOW) building for maintenance and storage of spare parts for tracks, vehicle propulsion equipment, train signals, and other infrastructure, in addition to storage facilities for the entire Link system. Other facility elements would include employee and visitor parking, operations staff offices, maintenance staff offices, dispatcher work stations, an employee report room, and areas with lockers, showers, and restrooms for both operators and maintenance personnel.

1.2 Regulatory Environment

OMF South must comply with multiple federal, state, and local environmental laws, regulations, and policies for environmental review. A brief discussion of these and their consideration of cultural resources is presented below.

FTA is the lead agency under the National Environmental Policy Act (NEPA). Under NEPA, cultural resources encompass a wide range of resources including, but not limited to, sacred sites, archaeological and built environment resources not eligible for the NRHP, archaeological and built environment resources eligible for the NRHP, and archaeological collections.

As federal funding is anticipated and the project is defined as a federal undertaking, it is subject to compliance with Section 106 of the NHPA, as amended, and its implementing regulations described in 36 Code of Federal Regulations (CFR) Part 800. Section 106 requires that federal agencies account for the effects of their undertakings on historic properties. A historic property is typically aged 50 years or older and is defined in 36 CFR Part 800.16(l)(1) as follows:

> … any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization and that meet the National Register criteria.

Regulations at 36 CFR Part 800 require the federal agency involved in the undertaking to identify the APE, conduct an inventory of historic properties that may be located within the APE, determine whether any of the historic properties identified are eligible for listing in the National Register of Historic Places (NRHP), and determine whether NRHP-eligible properties will be affected by the undertaking. An APE is defined in 36 CFR 800.16(d) as follows:

> … the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist. The APE is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking …

In addition to Section 106, Section 4(f) of the U.S. Department of Transportation Act of 1966 is triggered by funding or approval from a federal agency for a project that proposes “use” of historic property. A determination of adverse effect under Section 106 generally constitutes a use under Section 4(f).

The project must also comply with Washington State Environmental Policy Act (SEPA). Sound Transit is the lead agency for SEPA compliance. The project is subject to other Washington state laws that address the protection of archaeological sites and Native American burials. For example, the Archaeological Sites and Resources Protection Act (Revised Code of Washington [RCW] 27.53), prohibits disturbance of known precontact and historic archaeological sites on public or private lands. The Indian Graves and Records Act (RCW 27.44) prohibits disturbance of Native American graves and provides that inadvertent disturbance through construction or other activity requires reinternment under supervision of the appropriate tribes.

Certified Local Governments (CLGs) are considered the experts on whether resources meet the criteria for local listing in city or county registers of historic places. Consulting parties, including SHPO, provide expert opinions on whether a proposed project has the potential to adversely impact cultural resources.

2 Archaeological Resources

On-site staff will follow the procedures described below and illustrated in the flowchart on Figure 1 - Standard Inadvertent Discovery Process for Archaeological Resources on FTA Region 10 Projects. The contact phone tree and examples of archaeological resources are provided in Appendix A - On-Site Inadvertent Discovery Guide.

An archaeological resource could be prehistoric or historic. When in doubt, assume the material is an archaeological resource.

Examples of prehistoric archaeological materials include:

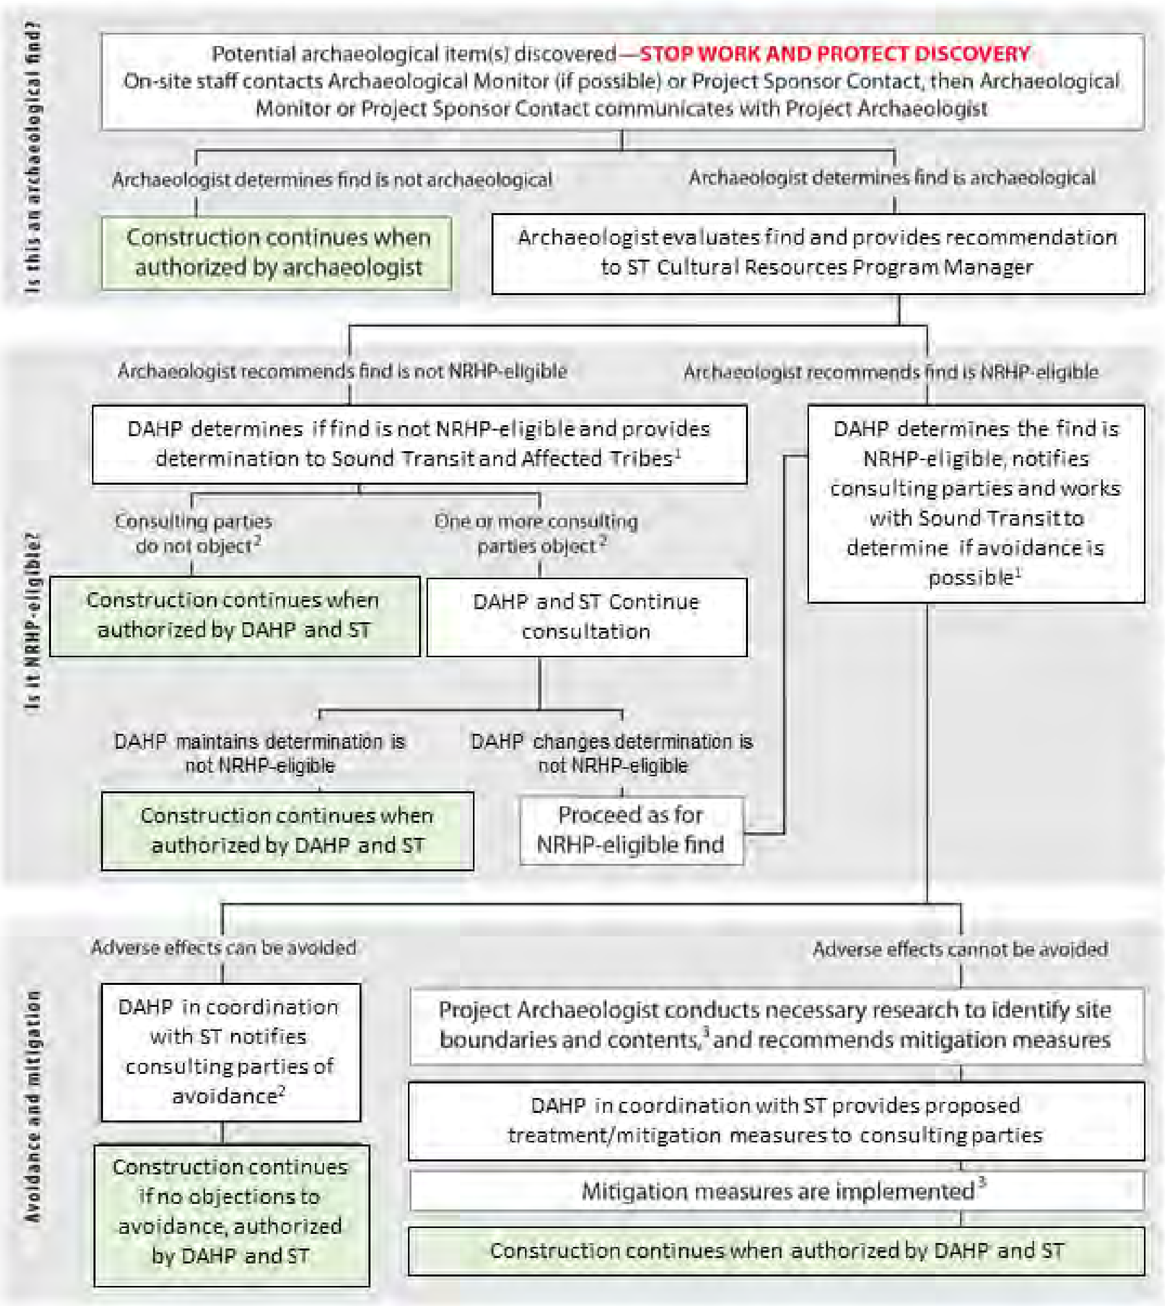
- An accumulation of shell, burnt rocks, or other food-related materials
- Bones or small pieces of bone
- An area of charcoal or very dark stained soil with artifacts
- Stone tools or waste flakes (i.e., an arrowhead or stone chips)
- Basketry, cordage, or rope
- Wooden posts or stakes

Examples of potentially historic archaeological materials include:

- Domestic ceramics (such as tableware, crockery, etc.) and industrial ceramics (such as insulators, tile, etc.)
- Glass, including bottles, tableware, window glass, wire glass, or multiple glass fragments
- Metal items, including equipment, vehicle parts, agricultural items, enameled ironware, etc.
- Bakelite, celluloid, glass, and shell buttons
- Punch-opened and solder-sealed beverage cans, solder-sealed food tins, general lack of thin-walled aluminum and welded steel cans
- Residential structural remains, such as historic building foundations or privies

NOTE: Items made of plastic, polystyrene, nylon, or Styrofoam, or those with modern markings (e.g., candy wrappers, or bottles and cans recognizable as modern) are not archaeological resources and do not constitute an inadvertent discovery.

Figure 1: Standard Inadvertent Discovery Process for Archaeological Resources on FTA Region 10 Projects



Is this an archaeological find?
Potential archaeological item(s) discovered—STOP WORK AND PROTECT DISCOVERY
On-site staff contacts Archaeological Monitor (if possible) or Project Sponsor Contact, then Archaeological Monitor or Project Sponsor Contact communicates with Project Archaeologist
Archaeologist determines find is not archaeological
Archaeologist determines find is archaeological
Construction continues when authorized by archaeologist
Archaeologist evaluates find and provides recommendation to ST Cultural Resources Program Manager
Is it NRHP-eligible?
Archaeologist recommends find is not NRHP-eligible
Archaeologist recommends find is NRHP-eligible
DAHP determines if find is not NRHP-eligible and provides determination to Sound Transit and Affected Tribes1
DAHP determines the find is NRHP-eligible, notifies consulting parties and works with Sound Transit to determine if avoidance is possible1
Consulting parties do not object2
One or more consulting parties object2
Construction continues when authorized by DAHP and ST
DAHP and ST Continue consultation
DAHP maintains determination is not NRHP-eligible
DAHP changes determination is not NRHP-eligible
Construction continues when authorized by DAHP and ST
Proceed as for NRHP-eligible find
Avoidance and mitigation
Adverse effects can be avoided
Adverse effects cannot be avoided
DAHP in coordination with ST notifies consulting parties of avoidance2
Project Archaeologist conducts necessary research to identify site boundaries and contents,3 and recommends mitigation measures
DAHP in coordination with ST provides proposed treatment/mitigation measures to consulting parties
Construction continues if no objections to avoidance, authorized by DAHP and ST
Mitigation measures are implemented3
Construction continues when authorized by DAHP and ST

1 Consulting parties must be notified within 48 hours of an archaeological discovery
2 Consulting parties have 48 hours to respond to agency determinations regarding discoveries
3 Under Washington State Law, an excavation permit may be required prior to completion of this step

2.1 On-Site Staff Responsibilities

The following section describes the steps to follow if an on-site Sound Transit employee, contractor, or subcontractor believes that they have uncovered a potential archaeological resource (a find) at any point in the project.

IDP Terminology

A **find** is a discovery during construction that could potentially be an archaeological resource.

An **archaeological resource** is an artifact or feature (or group of artifacts or features) older than 50 years.

An **NRHP-eligible archaeological resource** is one that has been evaluated and meets the criteria for listing in the National Register of Historic Places. (NRHP).

1. **Stop Work:** All work on site and in areas adjacent to the find will stop. The area of work stoppage will be adequate to protect the find from any further disturbance; this is expected to be 30 feet in any direction, unless site conditions indicate otherwise. The location of the find will be secured at all times. The find will not be handled, removed, reburied, or covered. The Contractor will install a physical barrier (e.g., exclusionary fencing) and prevent all machinery, other vehicles, and unauthorized individuals from crossing the barrier until the Project Archaeologist examines and verifies the find. Vehicles, equipment, and unauthorized personnel will not be permitted to traverse the discovery area. Spoils piles or vehicles (such as dump trucks) with the potential to contain archaeological resources will remain on site. Work at the location of the find will not resume until authorized by DAHP in coordination with ST.

2. **Notify the Archaeological Monitor:** If there is an archaeological monitor on site, notify that person. The monitor will contact Alex Stevenson, Cultural Resources Program Manager, Sound Transit, unless there is a monitoring plan in place that directs the monitor to do otherwise. If Alex Stevenson is not available, the monitor will contact Hussein Rehmat, Environmental Planner, Sound Transit.

3. **Notify Project Management:** If there is no archaeological monitor on site, contact Alex Stevenson. If they are not available, contact Hussein Rehmat. The Sound Transit representative will make all other contacts.

4. **Avoid Any Other Communication:** Do not call 911, the media, or members of the public about the find.

2.2 Project Manager Responsibilities

1. **Contact the Project Archaeologist:** Alex Stevenson of Sound Transit or designee will contact the Project Archaeologist, Ron Adams (or, if there is not one, designate a qualified archaeologist), to evaluate whether the find is an archaeological resource as defined by state or federal law. If the Project Archaeologist recommends that the find is not an archaeological resource, the Project Archaeologist can authorize work to continue.

2. **Determine Area Adequate for Protection:** If the Project Archaeologist recommends that the find is an archaeological resource, the Project Archaeologist will determine the area and the means adequate for protection and instruct the Contractor to maintain or adjust the protected area accordingly.

3. **Notify Consulting Parties:** The Project Archaeologist will notify DAHP in coordination with ST of the discovery of an archaeological resource. DAHP in coordination with ST shall notify consulting parties (SHPO, tribes, and any other identified interested parties) of the find within 48 hours, per 36 CFR Part 800.13.

4. **Research to evaluate NRHP-Eligibility:** The Project Archaeologist will conduct any additional research necessary to evaluate National Register of Historic Places (NRHP) eligibility of the archaeological resource. Based on this research, the Project Archaeologist will recommend to ST and DAHP whether the archaeological resource is NRHP-eligible. This additional research may include preparation of an archaeological excavation permit which will be prepared by ST and reviewed by DAHP in consultation with consulting parties. DAHP will authorize this permit and allow research to continue as appropriate.

5. **Formally Determine NRHP-Eligibility and Continue Consultation:** DAHP in coordination with ST shall determine whether the archaeological resource is NRHP-eligible and shall provide the determination to consulting parties. Consulting parties shall respond within 48 hours, per 36 CFR Part 800.13.

   If DAHP in coordination with ST determines that the archaeological resource is not NRHP-eligible and consulting parties do not object within 48 hours, construction may continue when authorized by DAHP in coordination with ST. If any consulting party objects, DAHP in coordination with ST shall continue consultation with all consulting parties in good faith to resolve the lack of agreement.

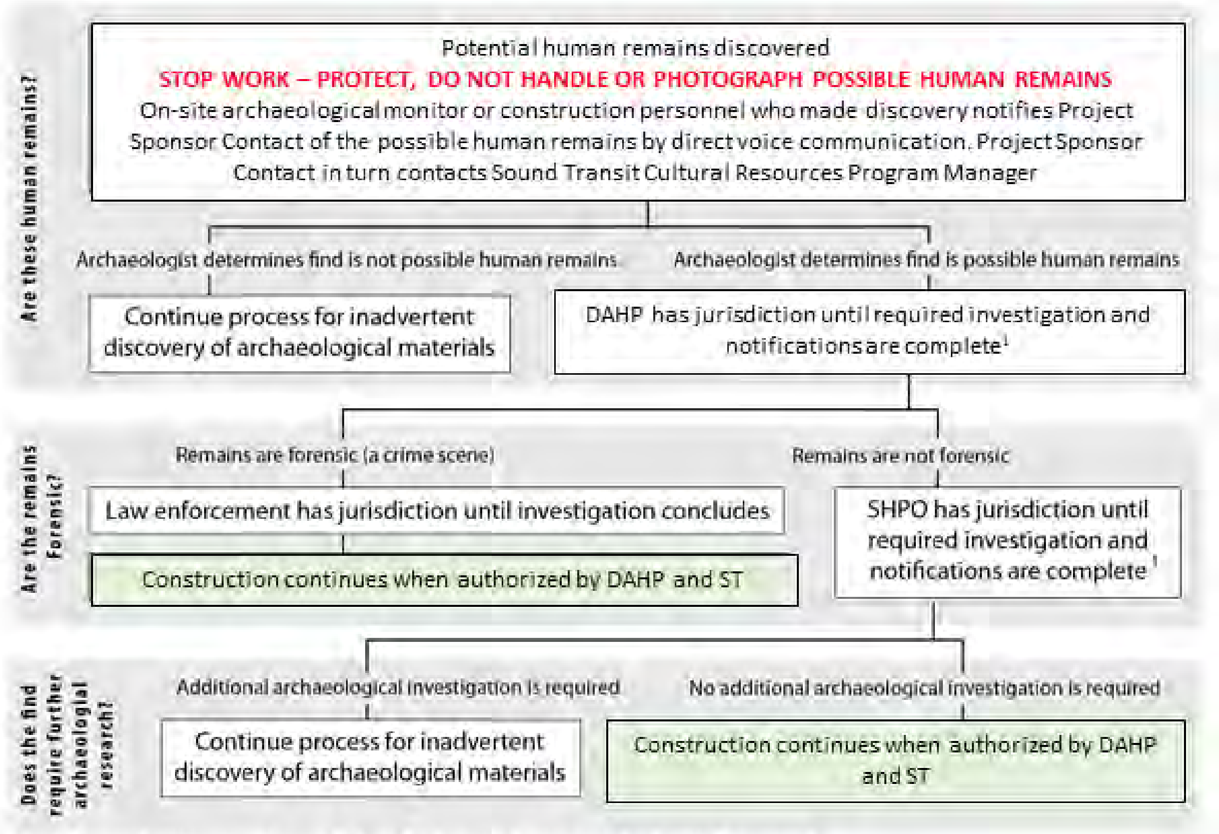
6. **Avoid or Mitigate Adverse Effects:** If DAHP in coordination with ST determines that the archaeological resource is NRHP-eligible, DAHP will work with ST to determine whether adverse effects can be avoided. If adverse effects can be avoided, DAHP in coordination with ST shall provide documentation of avoidance and a determination of No Adverse Effect to consulting parties. If consulting parties do not object within 48 hours, construction may continue when authorized by DAHP in coordination with ST. If any consulting party objects, DAHP in coordination with ST shall continue consultation with all consulting parties in good faith to resolve the lack of agreement.

   If DAHP in coordination with ST determines that adverse effects cannot be avoided, DAHP will work with ST and consulting parties to implement mitigation measures outlined in an excavation permit. This permit may be the same as the initial excavation permit from Step 5 or preparation of an additional excavation permit may be required.

3 Human Remains

Uncovered human remains on project construction site require special treatment under RCW 68.50.645. Any potential remains that are encountered during project work should be assumed to be human until determined otherwise by the Project Archaeologist or the applicable County Medical Examiner. Procedures for the discovery of possible human remains are shown in Figure 2 and described below.

Figure 2: Process for Discovery of Possible Human Remains



Are these human remains?
Potential human remains discovered
STOP WORK – PROTECT, DO NOT HANDLE OR PHOTOGRAPH POSSIBLE HUMAN REMAINS
On-site archaeological monitor or construction personnel who made discovery notifies Project Sponsor Contact of the possible human remains by direct voice communication. Project Sponsor Contact in turn contacts Sound Transit Cultural Resources Program Manager
Archaeologist determines find is not possible human remains
Archaeologist determines find is possible human remains
Continue process for inadvertent discovery of archaeological materials
DAHP has jurisdiction until required investigation and notifications are complete1
Are the remains Forensic?
Remains are forensic (a crime scene)
Remains are not forensic
Law enforcement has jurisdiction until investigation concludes
Construction continues when authorized by DAHP and ST
SHPO has jurisdiction until required investigation and notifications are complete1
Does the find require further archaeologial research?
Additional archaeological investigation is required
No additional archaeological investigation is required
Continue process for inadvertent discovery of archaeological materials
Construction continues when authorized by DAHP and ST

1 Notification requirements depend, in part, on whether the remains are Native American.

3.1 On-Site Staff Responsibilities

On-site staff will follow the procedures described below. The contact phone tree is shown in Appendix A - On-Site Inadvertent Discovery Guide.

1. **Stop Work:** If any Sound Transit employee, contractor, or subcontractor believes that he or she has uncovered possible human remains at any point in the project, all work on site and in areas adjacent to the discovery will stop. The area of work stoppage will be adequate to

protect the discovery, which is expected to be a minimum of 30 feet in all directions, unless the Project Archaeologist or law enforcement personnel indicate otherwise.

2. **Do Not Handle Human Remains:** Possible human remains shall not be handled, removed, reburied, or covered.
3. **Flag and Secure the Area:** The area of discovery will be flagged and secured. The location of the discovery will be secured at all times. Construction equipment and personnel will not enter the area. Spoils piles or vehicles from the area that have the potential to contain human remains, such as dump trucks, will remain on site. No persons other than the proper law enforcement personnel, the applicable County Medical Examiner, and professional archaeologists will be authorized to access the discovery location after the area is secured.
4. **Notify the Archaeological Monitor:** If there is an archaeological monitor on site, notify that person. The monitor will contact Alex Stevenson, Cultural Resources Program Manager, Sound Transit, unless there is a monitoring plan in place that directs the monitor to do otherwise. If Alex Stevenson is not available, the monitor will contact Hussein Rehmat, Environmental Planner, Sound Transit.
5. **Notify Project Management:** If there is no archaeological monitor on site, contact Alex Stevenson. If they are not available, contact Hussein Rehmat. The Sound Transit representative will make all other contacts.
6. **Avoid Any Other Communication:** Do not call 911, the media, or members of the public about the find.

3.2 Project Manager Responsibilities

1. **Preliminary Observation:** The Sound Transit Cultural Resources Program Manager of Sound Transit will notify DAHP (via phone) of the discovery, and will coordinate with the Project Archaeologist to assess whether the discovery may be human remains (without disturbing the discovery further). If the discovery can be definitively identified as nonhuman, procedures for archaeological resources will be followed.
2. **Notify Local Law Enforcement:** If the discovery could possibly be human remains, Sound Transit Cultural Resources Program Manager or the Project Archaeologist shall call the Federal Way Police Department nonemergency number and report that potential human remains have been discovered. The Federal Way Police Department will control the discovery site until it is either determined to be non-forensic (not a crime scene) or the investigation is complete.
3. **Participate in Consultation:** FTA and the Sound Transit Cultural Resources Program Manager will participate in consultation. If there are also archaeological materials at the

human remains discovery location, there may be a parallel archaeological resources process led by DAHP. Construction can resume when authorized by DAHP and ST.

4 Construction Team Training, Communication, and Reporting

4.1 Preconstruction Meeting

A preconstruction meeting will be held for the Project Archaeologist, Construction Management Lead, Resident Engineer, Contractor's project manager, Project Superintendent, and other personnel responsible for overseeing ground-disturbing field operations to:

- Review IDP procedures
- Provide introductions of the Sound Transit representatives, the Project Archaeologist, and other personnel
- Describe the role of the Project Archaeologist
- Establish a chain of command for communication and decision-making among the Project Archaeologist and Sound Transit and Contractor personnel
- Clarify questions about stop-work and notification procedures
- Provide a copy of the On-Site Inadvertent Discovery Guide (Appendix A) to field staff providing oversight of ground-disturbing work.

The preconstruction meeting will occur prior to any ground-disturbing activity. Additional meetings will be scheduled if there is substantial staff turnover, concern about staff understanding the protocols, a long break in construction, or a desire for refresher training on policy. The Project Archaeologist will remain in contact with Sound Transit Cultural Resources Program Manager and Sound Transit throughout the project to determine if site visits, additional meetings, or orientations are needed.

4.2 Construction Crew Member Orientation

The Project Archaeologist may provide on-site cultural resources orientation for all construction crew members leading ground-disturbing construction work. Orientation will inform and familiarize construction personnel with the IDP protocols and their responsibility to call attention to any archaeological materials they observe. The Sound Transit Cultural Resources Program Manager will coordinate with the Project Archaeologist to provide a brief orientation to construction crew members, as appropriate.

4.3 Ongoing Communication

The Sound Transit staff, contractor, and its agents will abide by established communication protocols described in the inadvertent discovery processes in Sections 2 and 3 regarding any archaeological resource matters that arise during construction. The Project Archaeologist will remain in communication with the Sound Transit Cultural Resources Program Manager (or designee), as appropriate, throughout project construction, via email and phone. If any member of the Project team feels communication is inadequate to ensure that the archaeologist is on site when it is prudent, the Project team member can contact DAHP. DAHP will coordinate with Sound Transit on how to improve communication.

4.4 Reporting of Inadvertent Discoveries

The responsibilities of the Project team include assessments of any inadvertent discoveries and a summary of results at the conclusion of construction. Reports regarding assessments of any inadvertent discoveries will be provided by Sound Transit to DAHP for review before submission to consulting parties. For all reporting, sensitive information regarding archaeological resources, human remains, funerary objects, or traditional practices shall not be released except as authorized by DAHP under applicable state.

Assessment of Inadvertent Discoveries

The Project Archaeologist will be responsible for preparing an assessment of all inadvertent discoveries during construction. The assessment will be used by DAHP to determine Section 106 eligibility and effects determinations and inform any additional coordination or investigation that may be necessary. The assessment will be prepared within 24 hours of an inadvertent discovery and can be provided to FTA in a memorandum or email. It will include the following information:

1) A description of the find, in enough detail to characterize its features and age. The description should include at least one photograph of the find.

2) A description and map of where the find occurred, including its context with adjacent features. The location of the find should be identified on a map that also identifies other known historic properties, if relevant.

3) Whether or not the find is an archaeological resource.

4) For archaeological resources, a recommendation of NRHP-eligibility that includes a statement of the age of the find, evaluation of find against each NRHP criterion, and a description of the integrity of the find.

5 Archaeological Resources and Collection Curation

No artifact shall be removed or taken by any construction crew member, regardless of archaeological significance or the disposition of the artifact. If a NRHP-eligible resource is encountered and the Archaeological Treatment Plan includes excavation or removal of the archaeological materials, the plan will specify collection and curation requirements. If artifacts are removed from the site for analysis and determined ineligible, the Project Archaeologist will dispose of the material.

1 INTRODUCTION

Sound Transit received 272 communications providing comments on the State Environmental Policy Act (SEPA) Draft Environmental Impact Statement (EIS) published in 2021(herein referred to as the 2021 Draft EIS) and 58 communications on the National Environmental Policy Act (NEPA) Draft/SEPA Supplemental Draft EIS published in 2023 (herein referred to as the 2023 Draft EIS). Copies of the letters are attached along with Sound Transit's responses to specific, substantive comments. Communications are grouped by Tribes, agencies, businesses and community organizations, and individuals.

1.1 Responses to Common Comments

Sound Transit reviewed all comments submitted during both comment periods. Many of the comments expressed similar themes, such as support for a particular alternative or concern about a specific issue. Table L.1-1 below provides responses to the most common comments. These responses are also referenced in the response to comments in Appendices L1 and L2, using the common comment number found in the first column of the table.

Table L.1-1 Responses to Common Comments

Number	Common Comment	Response
1	Sound Transit underestimated the impacts associated with business and employee displacements. The EIS should report an accurate number of employee displacements, or the total number of jobs gained or lost. Specifically, neither Ellenos Yogurt nor GarageTown could be easily relocated, and the impacts to those properties are not characterized adequately. GarageTown comprises multiple owners.	The number of displaced employees is based on the business building size (taken from King County Department of Assessment data) and the type of business activity using square-foot-per-employee factors from the U.S. Department of Energy and the Institute for Transportation Engineers. While not an actual survey of businesses, it allows an equal comparison among alternatives without having to access confidential or proprietary business information. The Final EIS does not calculate a net job gain or loss because relocation decisions are determined by individual business owners. Some displaced businesses may choose to relocate, while others may choose to permanently close when their property is purchased. As described in Section 3.3, Acquisitions, Displacements, and Relocations, Sound Transit provides relocation assistance to displaced businesses and, on past projects, has successfully helped many businesses that chose to relocate within the project area. To estimate the number of GarageTown owners, Sound Transit used GarageTown's website to count the number of displaced units. The Final EIS acknowledges that both Ellenos Yogurt and GarageTown are unique facilities that would be challenging to relocate. This is described in Section 3.3, Acquisitions, Displacements, and Relocations.
2	There would be too many residential displacements with either of the alternatives in Federal Way. Many of these displacements would affect lower income and/or elderly residents. Relocation of residents of Belmor Mobile Home Park is of particular concern.	The Preferred Alternative would displace up to 97 residences, mostly concentrated in the Belmor residential area. Section 3.3, Acquisitions, Displacements, and Relocations, describes the relocation benefits for displaced residents (both owners and tenants); it also provides specific information about relocation of mobile homes. Displacements from all alternatives would occur in areas with concentrations of minority and low-income populations. Appendix E, Environmental Justice Assessment, discusses how displacements would affect low-income and minority populations and how Sound Transit would provide advisory

Table L.1-1 Responses to Common Comments (continued)

Number	Common Comment	Response
		services to help find comparable housing for these residents. For properties that require relocation, Sound Transit's policies and procedures comply with the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (as amended) and Washington State's relocation and property acquisitions requirements. In some cases, Sound Transit provides advisory services to property owners above the minimum requirements of federal and state law. Sound Transit would compensate affected property owners in accordance with Sound Transit's Real Estate Property Acquisition and Relocation Policy, Procedures, and Guidelines (Sound Transit 2017). Benefits would depend on the level of impact, available relocation options, and other factors. Sound Transit would offer relocation assistance that includes compensation and supporting services that consider the needs of those being relocated in order to help reduce inconveniences or hardships. Sound Transit would also satisfy federal and state requirements for residential relocation, which define a "comparable replacement dwelling" as having the following attributes: • Decent, safe, and sanitary • Adequate in size to accommodate the occupants • Within the financial means of the displaced person • Functionally equivalent • In an area not subject to unreasonable adverse environmental conditions • In a location generally not less desirable than the location of the displaced person's dwelling with respect to public utilities, facilities, services, and the displaced person's place of employment To meet these requirements, Sound Transit may identify relocation properties that are in better condition and of higher value than the properties being acquired. If so, tenants may be eligible for a down payment or rent supplement.
3	Hylebos Creek and associated wetlands are important and need to be protected.	Section 3.10, Ecosystem Resources, of the Final EIS discusses the project's anticipated impacts (and proposed mitigation) to two tributaries to Hylebos Creek and associated wetlands. In addition, the Final EIS recognizes that the project would impact existing vegetation, including mature forested buffer areas. Impacts to the two tributaries to Hylebos Creek and wetlands have been avoided and minimized, where possible, during conceptual design. After publication of the 2021 SEPA Draft EIS, Sound Transit modified the design of the Preferred Alternative to reduce impacts to streams and wetlands. Further avoidance and minimization of wetland impacts would occur during future design and permitting of the project. Native vegetation would be restored in wetlands and buffers temporarily affected by construction. Sound Transit has committed to achieving no net loss of wetland function and area on a project-wide basis. As part of the Section 404 and Section 401 permitting process under the Clean Water Act, Sound Transit would work with Tribes

Table L.1-1 Responses to Common Comments (continued)

Number	Common Comment	Response
		and resource agencies to develop a mitigation approach. As part of this approach, Sound Transit would develop plans for compensatory mitigation for the effects of the project on wetlands, streams, and regulatory buffers on a watershed basis. Potential mitigation areas downstream of the preferred alternative would enhance and restore wetlands and streams that contribute to the overall health of salmonids in the West Fork Hylebos Creek drainage. To the extent possible, off-site compensatory mitigation sites would be identified and would compensate for lost values in kind.
4	Comments limited to expressing a preference or objection to one or more alternatives, including preferences or objections supported by non-substantive comments or analysis already provided in the EIS. In particular, many commenters expressed a preference for the Midway Landfill Alternative, based on the following reasons: • Large, mostly vacant site • Relatively few natural environment impacts • Relatively few business displacements • No residential displacements • Brownfield redevelopment potential Commenters opposed the South 344th Street Alternative because: • Greatest number of business and employee displacements • Impacts to GarageTown and Ellenos Yogurt • Ecosystem impacts • Residential displacements due to the mainline alignment Reasons commenters gave for opposing the Preferred Alternative included: • Ecosystem impacts • Displacement of Christian Faith Center • Residential displacements due to the mainline alignment	Sound Transit reviewed all comments submitted during the 2021 SEPA Draft EIS and 2023 NEPA Draft/SEPA Supplemental Draft EIS comment periods. NEPA and SEPA require Sound Transit to respond to substantive comments related to the content of the Draft EIS, but not to questions or comments limited to public policy decisions (e.g., general statements of support or opposition). Before identifying the Preferred Alternative, the Sound Transit Board received a comment summary report that included a copy of all comments submitted on the 2021 SEPA Draft EIS in November 2021. Appendix L of the Final EIS includes copies of the comments and responses to substantive comments made on both the 2021 SEPA Draft EIS and the 2023 NEPA Draft/SEPA Supplemental Draft EIS. The Midway Landfill Alternative was initially identified for study largely due to attributes that many commenters found appealing. While the Board did not identify the Midway Landfill Alternative as the Preferred Alternative for evaluation in the Final EIS, it is being carried forward as an alternative for consideration. After considering the Draft EIS comments, analysis in the Final EIS, and other factors, the Sound Transit Board will select the project to be built.
5	Sound Transit should identify sources of federal funding for the project. Specifically, there are funds related to Superfund site redevelopment that could lower the costs of developing the Midway Landfill Alternative.	Sound Transit executed a grant agreement with the FTA in December 2023 for $4.9M in 5307 funds for OMF South. Sound Transit will continue pursuing applicable federal funding sources to help fund the project including, but not limited to FTA's Capital Investments Grants programs (e.g., Expedited Project Delivery, Full Funding Grant Agreement), a U.S. DOT Build America Bureau Transportation Infrastructure Finance and Innovation Agreement (TIFIA) loan, and other federal sources such as EPA programs (e.g., Brownfields and Climate Pollution Reduction).

Tribes and Agencies

OMF South Draft Environmental Statement (EIS)

Sound Transit Review Board

The Puyallup Tribe Fisheries Department offers the following comments concerning the proposed Operations and Maintenance Facility South site alternatives. The South 336th St. and South 344th St alternatives would each require that significant portions of Hylebos Creek be tight lined to varying degrees. While each of the Alternatives identified likely has its merits, we wish to remind Sound Transit that the Puyallup Tribe, the Natural Resource Damage Trustees, the City of Tacoma and the Port of Tacoma as well as WSDOT have collectively spent tens of millions of dollar on property acquisition, habitat restoration, contaminants cleanup and stream enhancement projects throughout the Hylebos Creek watershed over the past 20 years.

In addition, WSDOT will be expanding the wetland and stream habitat complex as part of the Riparian Restoration Plan for the SR 167/SR 509 interchange known as the Gateway project. This entails enhancing over 153 acres of wetland, riparian and forested habitat forming a critical link to previously established mitigation sites located downstream of the two Federal Way OMF proposed alternative sites.

Fundamental to the success of these efforts is the protection and treatment of stormwater which originates throughout the Hylebos Creek basin including several of the sites submitted for consideration to host the OMF South complex. Placing any more of Hylebos Creek into a pipe/culvert runs counter to years of planning and restoration work that has already been achieved. Pipelines and underground drainage conveyances offer no means of water treatment or groundwater recharge whatsoever and are therefore viewed as incompatible with fish recovery.

Summer base flow conditions within Hylebos Creek are a limiting factor for salmonid production. Many reaches of Hylebos Creek that were formerly wetted year around are now ephemeral. Reduced flow conditions are more susceptible to thermal inputs and rapid heating which places additional stress on fish populations. Any further loss of water treatment opportunities and recharge are not an acceptable option for the tribe.

3.1.1.3 Appendix G3 - Distribution of Fish

Chinook salmon have been documented upstream of the Montessori School to 356th St on the West Fork. This fact is continuously ignored and the tribe's data is not referenced anywhere in the DEIS.

3.10.1.1 Aquatic Species and Habitat

While it is true, fish are not present in any of the proposed alternative sites, water quality and quantity impacts can and will affect downstream fish populations. Pink, coho, chinook, steelhead and cutthroat occupy Hylebos Creek downstream of the project impact area.

The Midway Land fill site remains the Tribes preferred alternative as it has the least impacts to forests, no stream impacts and no wetland impacts.

Thank you for your consideration of these comments!

Sincerely,

Russ Ladley, Director
Puyallup Tribal Fisheries

These comments were sent to Hussein Rehmat at (206) 689-4828 or email Hussein.Rehmat@soundtransit.org, OMFSouth@soundtransit.org on April 19, 2021.

Puyallup Tribe Fisheries Department (Communication ID 473825)		
Comment ID	**Comment Text**	**Response**
1	The Puyallup Tribe Fisheries Department offers the following comments concerning the proposed Operations and Maintenance Facility South site alternatives. The South 336th St. and South 344th St alternatives would each require that significant portions of Hylebos Creek be tight lined to varying degrees. While each of the Alternatives identified likely has its merits, we wish to remind Sound Transit that the Puyallup Tribe, the Natural Resource Damage Trustees, the City of Tacoma and the Port of Tacoma as well as WSDOT have collectively spent tens of millions of dollar on property acquisition, habitat restoration, contaminants cleanup and stream enhancement projects throughout the Hylebos Creek watershed over the past 20 years.	Sound Transit appreciates the continued coordination with the Puyallup Tribe of Indians. Sound Transit understands the long-term effort and investment that has been made over the past many years to restore stream and wetland habitat within the Hylebos Creek watershed through a collective effort of that has included the Puyallup Tribe of Indians, the cities, and others. The OMF South project is striving to avoid new tightlining or piping of open channel tributaries to Hylebos Creek and is committed to working with the Tribe through the duration of the project.
2	In addition, WSDOT will be expanding the wetland and stream habitat complex as part of the Riparian Restoration Plan for the SR 167/SR 509 interchange known as the Gateway project. This entails enhancing over 153 acres of wetland, riparian and forested habitat forming a critical link to previously established mitigation sites located downstream of the two Federal Way OMF proposed alternative sites.	Section 4.4.9, Ecosystems, in Chapter 4, Cumulative Effects Analysis, has been updated in the Final EIS to describe WSDOT's Riparian Restoration Plan for the Gateway project. Sound Transit acknowledges that the Puyallup Tribe of Indians and WSDOT have put considerable effort and planning into the Riparian Restoration Plan for the Puget Sound Gateway Program's SR 167 and SR 509 Completion projects to provide a large mitigation site in the lower Hylebos Creek area.
3	Fundamental to the success of these efforts is the protection and treatment of stormwater which originates throughout the Hylebos Creek basin including several of the sites submitted for consideration to host the OMF South complex. Placing any more of Hylebos Creek into a pipe/culvert runs counter to years of planning and restoration work that has already been achieved. Pipelines and underground drainage conveyances offer no means of water treatment or groundwater recharge whatsoever and are therefore viewed as incompatible with fish recovery. Summer base flow conditions within Hylebos Creek are a limiting factor for salmonid production. Many reaches of Hylebos Creek that were formerly wetted year around are now ephemeral. Reduced flow conditions are more susceptible to thermal inputs and rapid heating which places additional stress on fish populations. Any further loss of water treatment opportunities and recharge are not an acceptable option for the tribe.	Stormwater management and groundwater are discussed in Section 3.11, Water Resources, in the 2023 Draft EIS and this Final EIS. The project would include stormwater flow control measures and enhanced stormwater treatment to protect water quality after the project is constructed. Sound Transit is striving to avoid the placement of new pipes or new culverts into Hylebos Creek tributaries. As the design progresses, Sound Transit is committed to working with the Tribe through project design on methods to implement water treatment and avoid and minimize impacts to groundwater recharge.
4	3.1.1.3 Appendix G3 - Distribution of Fish Chinook salmon have been documented upstream of the Montessori School to 356th St on the West Fork. This fact is continuously ignored and the tribe's data is not referenced anywhere in the DEIS.	Section 3.10, Ecosystems Resources, and Appendix G3, Ecosystems Resources Technical Report, was revised in the 2023 Draft EIS to reference the Tribe's annual fisheries reports (from 2017 to 2023). The presence of Chinook up to S 356th Street is included in the document. This update is reflected in this Final EIS.

Puyallup Tribe Fisheries Department (Communication ID 473825)

5	3.10.1.1 Aquatic Species and Habitat While it is true, fish are not present in any of the proposed alternative sites, water quality and quantity impacts can and will affect downstream fish populations. Pink, coho, chinook, steelhead and cutthroat occupy Hylebos Creek downstream of the project impact area.	Section 3.10, Ecosystem Resources, of the 2023 Draft EIS and this Final EIS discusses effects to downstream aquatic habitat that could occur due to changes in water quality or quantity.
6	The Midway Land fill site remains the Tribes preferred alternative as it has the least impacts to forests, no stream impacts and no wetland impacts.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Operations and Maintenance Facility South, Sound Transit
MARCH 2021 DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS)
Review Comments

Organization:	WASHINGTON STATE DEPARTMENT OF ECOLOGY, TOXICS CLEANUP PROGRAM, NORTHWEST REGIONAL OFFICE
Date:	MARCH 5 - APRIL 19, 2021

ID	Section	Page	Paragraph/Table/Figure	Lin	Comment	Column1	Commenter's Name
1	Executive Summary, 3.13, Appendix D3 Section 2.6.2.3	ES-14, ES-24, 3.13-11, App D3 p. 30			What is the differential excavation volume of "full excavation of the entire landfill" compared to "full landfill excavation needed to develop the OMF"? Was an alternative considered for full excavation and replacement with clean fill? Replacement with clean fill would realize the full benefit of landfill excavation. Returning potentially impacted soil to the landfill excavaton may result in placing contaminant source material back on the property. What would the differential construction and operating costs be for reused fill and clean fill? Appendix D3 Section 2.6.2.3 states "Environmental regulators may require any exhumed refuse to be disposed of at a permitted facility meeting current standards without the option to reuse on site." Would the decision on this requirement affect the OMF South location selection? Therefore, would a determination on soil reuse need to be made prior to site selection?	ECY	Mark Adams/Tanner Bushnell/Alan Noell
2	Executive Summary, Section 3.10.2.2, Section 3.11.2.2, App G3, Sect 4.1.2.1	ES-19, 3.10-13, 3.11-12, G3-73	Table ES-1		The Midway Landfill was completed with an impermeable 50-mil geomembrane cover. The overlying soil cap (12-inch sand, 12-inch topsoil) has limited storage potential for reducing peak drainage, so development of the OMF would have limited increase of impervious surfaces.	ECY	Alan Noell/ECY
3	3.11	3.11-12, 13	4-5		Is the platform description here current? Based on current design would all three Midway designs have similar access limitations to landfill management?	ECY	Tanner Bushnell
4	Appendix D1	34			A concern was expressed with mobilizing contamination though deep dynamic compaction. Areas of the landfill potentially containing liquid waste are a concern with regards to deep dynamic compaction.	ECY	Tanner Bushnell
5	Appendix D.2, Appendix D.3	p. 13 (pdf p 66), pp. 21-23 (pdf pp 126-128)	Section 2.1 (2/14/2020), Figures 2-1 to 2-3 (9/2020)		FWLE assumed 70% of screened landfill material would be reused (Interim Midway Landfill Preparation Memorandum, Draft 2, 2/14/2020). What was the actual reuse percentage? Was all material screened through 2-inch trommel reused? Was(Will) all 4-inch screen landfill material also (be) fed through a 2-inch trommel screen? What is the geotechnical criteria for reuse (e.g., percent organic matter). In the 2/14/2020 section, 50% reuse is assumed, but in the 9/2020 document, 40% reuse is assumed. What reuse percentage was assumed in the cost estimates? Was a sensitivity analysis performed? How significant of a driver is reuse percentage to the OMF costs?	ECY	Alan Noell/ECY
6	Appendix D.2	pp. 15 to 17 (pdf pp. 68-7	Section 2.3		"The FWLE project has been allowed to reuse refuse material onsite; however, the quality of that material is better understood and the scale of that work is significantly smaller than that proposed for OMF South." How is the FWLE and OMF project landfill material expected to be different? Would older waste contain less daily cover? Did the FWLE contain more soil because it's located along the edge of the landfill and the vertical and horizontal limits of the landfill were variable? How much dangerous waste was disposed during FWLE? Is all OMF waste assumed to be Subtitle D waste? Would older waste potentially contain more hazardous waste? Would older waste be more compacted, moist, and dense?	ECY	Alan Noell/ECY
7	Appendix D.3	p. 3 (pdf p 108)	Section 1.3		The 9/2020 Conceptual Landfill Site Reuse Plan refers to 9 acres of refuse on WSDOT property in the ROW. Was this waste removed as part of the FWLE project, or is this waste outside of the FWLE that will be conveyed to SPU?	ECY	Alan Noell/ECY
8	Appendix D.3	p. 10 (pdf p 115)	Section 2.2		"If EPA approves the project under Superfund, the development process for Midway Landfill may be exempt from.....NEPA." Also the project may be subject to NEPA by FHWA if airspace crosses WSDOT land. Would an additional NEPA or SEPA EIS be required once the OMF South location is selected?	ECY	Alan Noell/ECY

Operations and Maintenance Facility South, Sound Transit
MARCH 2021 DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS)
Review Comments

Organization:	WASHINGTON STATE DEPARTMENT OF ECOLOGY, TOXICS CLEANUP PROGRAM, NORTHWEST REGIONAL OFFICE
Date:	MARCH 5 - APRIL 19, 2021

ID	Section	Page	Paragraph/Table/Figure	Lin	Comment	Column1	Commenter's Name
9	Appendix D.3	p. 10 (pdf p 115)	Section 2.2		"the existing ROD may not need to be reopended, if during the course of OMF South construction, the integrity of the existing, in-place remedies are maintained." ST and SPU would need to negotiate new legal agreements with Ecology. The existing legal agreements would need to be amended to allow construction and to maintain environmental controls after construction. Work plans would need to be developed to maintain environmental controls during construction.	ECY	Alan Noell/ECY
10	Appendix D.3	p. 11 (pdf p. 116)	Section 2.2		The document states the Seattle-King County Department of Public Health will need to be provided the opportunity to review requested operational changes at the site. Public Health - Seattle and King County (PHSKC) does not permit the Midway Landfill. PHSKC informed Ecology on 3/15/2005 that they would no longer perform periodic inspections of the CERCLA site due to changes in program funding in King County Board of Health Code, Title 10, effective 12/21/2003. Ecology has primacy, and intends to coordinate with other regulatory agencies for future changes to the landfill.	ECY	Alan Noell/ECY
11	Appendix D.3	p. 24 (pdf p. 129)	Section 2.6.2		How do the predicted and actual observed densities and reuse percentages vary for the FWLE project at Midway. If these are carried forward to the OMF facility, how would they impact the costs?	ECY	Alan Noell/ECY
12	Appendix D.3	p 47 (pdf p. 152)	Section 3.4		How do risks to schedule in the September 2020 compare with FWLE project experience?	ECY	Alan Noell/ECY
13	Appendix D.4	pp. 13-15 (pdf pp. 174-176)	Sections 2.3.1 and 2.3.2		The site geology and hydrogeology sections reference the 2000 ROD and 2015 Five-Year Review, and provide no maps and cross-sections for interpretations. The ROD and Five-Year Review don't provide this detail. The document also includes a minor reference to the 1988 Remedial Investigation prepared by Parametrix. Please reference subsequent geology and hydrogeology interpretations for the site (July 2020 Parametrix report).	ECY	Alan Noell/ECY
14	Appendix D3, 2.6.1	22-23	Figure 2-2 and 2-3		Do the figures of the Hybrid and Full Excavation options depict reuse soil volumes accounting for the volume of mix-in soil (assuming the reused soil will require added soil to improve quality)?	ECY	Tanner Bushnell
15	Appendix D3, 2.6.2.2	28-29	Drilled Shaft and Slab Installation		This paragraph suggests for Hybrid 2, full excavation of soil beneath the building would remove the need for drilled shafts to support the building. Was the cost of Hybrid 2 with this arrangement calculated?	ECY	Tanner Bushnell
16	Appendix D3, 2.6.2.3	29			The acreage of exposed landfill for excavation purposes may be determined based on performance. Without an example project with similar infiltration restrictions, it would be difficult for Ecology to specify an acceptable uncapped landfill area.	ECY	Tanner Bushnell
17	HHRA Addendum	9			Ambient temperature typo.	ECY	Tanner Bushnell

Ecology (Communication ID 473719)		
Comment ID	**Comment Text**	**Response**
1	What is the differential excavation volume of "full excavation of the entire landfill" compared to "full landfill excavation needed to develop the OMF"? Was an alternative considered for full excavation and replacement with clean fill? Replacement with clean fill would realize the full benefit of landfill excavation. Returning potentially impacted soil to the landfill excavation may result in placing contaminant source material back on the property. What would the differential construction and operating costs be for reused fill and clean fill? Appendix D3 Section 2.6.2.3 states "Environmental regulators may require any exhumed refuse to be disposed of at a permitted facility meeting current standards without the option to reuse on site." Would the decision on this requirement affect the OMF South location selection? Therefore, would a determination on soil reuse need to be made prior to site selection?	Sound Transit included the evaluation of a full excavation option that includes the reuse of some contaminated material to reduce cost, as opposed to using only clean fill. Complete backfill with clean material would require haul and disposal of an additional approximately 2,000,000 cubic yards of material, which would then require replacement with import material. This could result in up to $360M in additional costs. Previous meetings with Ecology and the fact that reuse was approved for FWLE indicate that it is an acceptable option. However, the acceptability of the soil for reuse would be largely determined by the degree of contamination. Based on the information available at the time, Sound Transit made a conservative assumption regarding how much soil would be suitable for reuse and how much would need to be removed from the site. The ability to reuse exhumed soil for the Midway Landfill Alternative factored into the overall construction cost and schedule estimates. The assumptions on soil reuse in Appendix D and construction cost and schedule estimates were available for the Board to consider in identifying the preferred alternative and will also be available when the Board selects the project to be built. A determination of soil reuse would be made if the Sound Transit Board selects the Midway Landfill Alternative to be built.
2	The Midway Landfill was completed with an impermeable 50-mil geomembrane cover. The overlying soil cap (12-inch sand, 12-inch topsoil) has limited storage potential for reducing peak drainage, so development of the OMF would have limited increase of impervious surfaces.	The text of the 2023 Draft EIS was revised to describe the nature of the landfill cap more accurately. Please see Section 3.11, Water Resources. This update is reflected in this Final EIS.
3	Is the platform description here current? Based on current design would all three Midway designs have similar access limitations to landfill management?	Section 3.11, Water Resources, in the 2023 Draft EIS was updated to include a discussion of the need to be able to continue landfill monitoring during construction activities. This update is reflected in this Final EIS.
4	A concern was expressed with mobilizing contamination though deep dynamic compaction. Areas of the landfill potentially containing liquid waste are a concern with regards to deep dynamic compaction.	Sound Transit updated Section 3.13, Hazardous Materials, of the 2023 Draft EIS to identify the concern of mobilizing contamination through deep dynamic compaction. This update is reflected in this Final EIS. If the Sound Transit Board selects to build the Midway Landfill Alternative, Sound Transit would coordinate with Ecology on the potential for mobilizing contamination with different construction methods.

5	FWLE assumed 70% of screened landfill material would be reused (Interim Midway Landfill Preparation Memorandum, Draft 2, 2/14/2020). What was the actual reuse percentage? Was all material screened through 2-inch trommel reused? Was (Will) all 4-inch screen landfill material also (be) fed through a 2-inch trommel screen? What is the geotechnical criteria for reuse (e.g., percent organic matter). In the 2/14/2020 section, 50% reuse is assumed, but in the 9/2020 document, 40% reuse is assumed. What reuse percentage was assumed in the cost estimates? Was a sensitivity analysis performed? How significant of a driver is reuse percentage to the OMF costs?	Previous meetings with Ecology and the approval of reuse for FWLE indicate that it is a potential option. However, the actual level of contamination would determine the acceptability of the material for reuse. Without knowing the level of contamination, Sound Transit estimated that most of the soil would need to be removed. Forty percent of material was assumed to be reusable based on the range of 30 to 50 percent recommended by the OMF South Preliminary Geotechnical Recommendations prepared for Sound Transit by Shannon & Wilson in June 2020. FWLE reused approximately 19,000 cubic yards of material. All material that was reused was run through both 4-inch and 2-inch screens. The reused material was allowed to contain up to 8 percent organic content, in specific areas noted in the construction drawings. A sensitivity analysis was performed by Kiewit, the design-builder, after they were awarded the contract. They used an upper bound of 10 percent organic matter to assess 100-year long-term settlement rates. Based on the analysis, Kiewit was allowed to use material with 10 percent organic matter at specific locations. All other locations with that reused screened material were required to follow WSDOT specifications that allow for no organic matter or deleterious material. Reuse of material has a lower cost than exporting contaminated soil and importing clean material. For example, a cubic yard of material that met the classification of a dangerous waste would cost a total of about $110 to dispose of and replace with clean backfill.

Ecology (Communication ID 473719)

6	“The FWLE project has been allowed to reuse refuse material onsite; however, the quality of that material is better understood and the scale of that work is significantly smaller than that proposed for OMF South.” How is the FWLE and OMF project landfill material expected to be different? Would older waste contain less daily cover? Did the FWLE contain more soil because it’s located along the edge of the landfill and the vertical and horizontal limits of the landfill were variable? How much dangerous waste was disposed during FWLE? Is all OMF waste assumed to be Subtitle D waste? Would older waste potentially contain more hazardous waste? Would older waste be more compacted, moist, and dense?	The waste material along the east edge of the landfill was not as deep as in other portions of the landfill, and the material was relatively clean. Therefore, a higher percentage of the sifted soil was reused for FWLE. However, OMF South would be located over a much larger volume of the landfill that accumulated across a longer era. There is a high risk that there would be contaminated soil and possible hazardous waste. Therefore, it is reasonable to assume a low level of soil reuse when costing the OMF South project. Older waste is typically more degraded and deeper and, therefore, denser. Older waste could potentially have higher levels of hazardous waste because of the relatively lax regulations that were in place at the time of disposal. The levels of hazardous waste also greatly depend on the operational practices used at the time. Of the landfill material that was unsuitable for reuse by FWLE, about 19,000 tons was considered municipal solid waste and about 40 tons was considered dangerous waste. As noted in Appendix D3, the analysis in the Conceptual Landfill Site Reuse Plan assumed that the majority of material would be accepted at a Subtitle D landfill while acknowledging the possibility that some waste could be considered hazardous and require disposal in a Subtitle C landfill.
7	The 9/2020 Conceptual Landfill Site Reuse Plan refers to 9 acres of refuse on WSDOT property in the ROW. Was this waste removed as part of the FWLE project, or is this waste outside of the FWLE that will be conveyed to SPU?	The refuse in the WSDOT ROW was removed as part of FWLE construction.
8	"If EPA approves the project under Superfund, the development process for Midway Landfill may be exempt from…..NEPA." Also the project may be subject to NEPA by FHWA if airspace crosses WSDOT land. Would an additional NEPA or SEPA EIS be required once the OMF South location is selected?	A NEPA Draft/SEPA Supplemental Draft EIS was published in September 2023 with FTA as the NEPA lead agency. To support future FHWA approvals, FHWA is a cooperating agency under NEPA.
9	"the existing ROD may not need to be reopened, if during the course of OMF South construction, the integrity of the existing, in-place remedies are maintained." ST and SPU would need to negotiate new legal agreements with Ecology. The existing legal agreements would need to be amended to allow construction and to maintain environmental controls after construction. Work plans would need to be developed to maintain environmental controls during construction.	If the Midway Landfill Alternative is selected as the project to be built, Sound Transit would coordinate with SPU and Ecology on necessary agreements and construction planning regarding the site.

Comment ID	**Comment Text**	**Response**
10	The document states the Seattle-King County Department of Public Health will need to be provided the opportunity to review requested operational changes at the site. Public Health - Seattle and King County (PHSKC) does not permit the Midway Landfill. PHSKC informed Ecology on 3/15/2005 that they would no longer perform periodic inspections of the CERCLA site due to changes in program funding in King County Board of Health Code, Title 10, effective 12/21/2003. Ecology has primacy, and intends to coordinate with other regulatory agencies for future changes to the landfill.	The reference to Public Health – Seattle & King County was an error in Appendix D3, the Conceptual Landfill Site Reuse Plan. The list of Anticipated or Potential Licenses, Permits, and Approvals in the 2021 Draft EIS Fact Sheet correctly lists Ecology as the reviewing agency.
11	How do the predicted and actual observed densities and reuse percentages vary for the FWLE project at Midway. If these are carried forward to the OMF facility, how would they impact the costs?	The waste material along the east edge of the landfill where the FWLE alignment is located was not as deep as other portions of the landfill and the material was relatively clean. Therefore, a higher percentage of the sifted soil was reused. However, with the OMF located across a much larger area and the volume of landfill accumulated over a longer timeframe, there is a high risk that there would be contaminated soil and possible hazardous waste. Therefore, it is prudent to assume a low level of soil reuse when costing the project.
12	How do risks to schedule in the September 2020 compare with FWLE project experience?	Section 3.4, Risks to Cost and Schedule, of Appendix D3, the Conceptual Landfill Site Reuse Plan, is a high-level analysis of the potential issues that could increase cost or delay schedule if the broad assumptions used in the plan turned out to be incorrect. The scope and extent of the two projects are so different that comparing them is not useful.
13	The site geology and hydrogeology sections reference the 2000 ROD and 2015 Five-Year Review, and provide no maps and cross-sections for interpretations. The ROD and Five-Year Review don't provide this detail. The document also includes a minor reference to the 1988 Remedial Investigation prepared by Parametrix. Please reference subsequent geology and hydrogeology interpretations for the site (July 2020 Parametrix report).	Documents included in Appendix D, Midway Landfill Support Documents, were used to develop potential construction design options to evaluate in the Draft and Final EISs. If the Midway Landfill Alternative is selected to be built, Sound Transit would advance the design and update the memo in coordination with Ecology.
14	Do the figures of the Hybrid and Full Excavation options depict reuse soil volumes accounting for the volume of mix-in soil (assuming the reused soil will require added soil to improve quality)?	The figures are simplified, showing proportions of reused and import material. In actual implementation, mixing of material to improve placement quality is likely.
15	This paragraph suggests for Hybrid 2, full excavation of soil beneath the building would remove the need for drilled shafts to support the building. Was the cost of Hybrid 2 with this arrangement calculated?	Further investigation and design would be needed to confirm that drilled shafts are not required under buildings when deep dynamic compaction is used on the remaining refuse material. The preliminary design used for the 2021 Draft EIS, the 2023 Draft EIS, and the Final EIS could not make that assumption, and the cost estimate included drilled shafts under the buildings only. Differential settlement between the track and the building is a risk as the track also runs through the buildings.

Ecology (Communication ID 473719)		
Comment ID	**Comment Text**	**Response**
16	The acreage of exposed landfill for excavation purposes may be determined based on performance. Without an example project with similar infiltration restrictions, it would be difficult for Ecology to specify an acceptable uncapped landfill area.	The assumed 5-acre open working area of exposed landfill was used to develop construction and schedule assumptions for conceptual design. If the Midway Landfill alternative is selected as the project to be built, Sound Transit would coordinate with Ecology to determine an acceptable area of uncapped landfill.
17	Ambient temperature typo.	Documents included in Appendix D, Midway Landfill Support Documents, were used to develop potential construction design options to evaluate in the Draft and Final EIS. If the Midway Landfill Alternative is selected to be built, Sound Transit would advance the design and update the documents accordingly.

Comment ID	**Comment Text**	**Response**
1	ST also needs to address impacts to existing vegetation outside RCAs and restore according to the WSDOT Roadside Policy Manual.	Section 3.7, Visual and Aesthetic Resources, of the 2023 Draft EIS was revised to include a discussion of impacts to existing landscapes within the WSDOT right-of-way and to reference the restoration requirements of the WSDOT Roadside Policy Manual. This update is reflected in this Final EIS.
2	ST should evaluate impact to fish passage projects upstream of this project to ensure that this project doesn't negatively impact the restoration of access to spawning habitat upstream.	Sound Transit has evaluated potential impacts that could affect the availability and accessibility of stream habitats in the future if access is restored through the removal of downstream fish passage barriers. Additionally, OMF South would be designed to ensure that it would not preclude future culvert replacement(s) by WSDOT to provide fish passage. This is documented in sections 3.10, Ecosystems Resources, and 4.1.2 of Appendix G3, Ecosystems Resources Technical Report, of the 2023 Draft EIS and this Final EIS.
3	It appears that parts 1 and 2 are repeated throughout this document	There was an error in the PDF posted to Sound Transit's website that included a repeat of Chapters 1 and 2.
4	Throughout section 3.7 there is no mention of the high awareness and high sensitivity viewer group that are persons driving for pleasure or tourists visiting an area to enjoy scenic features. They are instead just referred to as "I-5 and SR 99 Drivers", with no differentiation. This higher sensitivity viewer group needs to be considered in the EIS. Description of figure in following paragraph omits high-sensitivity viewers such as tourists and sight-seers. Description of figure in following paragraph omits high-sensitivity viewers such as tourists and sight-seers. Please address the impact to high-sensitivity viewers such as tourists and sight-seers.	The text in Section 3.7, Visual and Aesthetic Resources, of the 2023 Draft EIS was revised to state that people sightseeing on highways or driving through their neighborhood are considered to have medium to high viewer sensitivity. This update is reflected in the Final EIS. Commuters and other drivers primarily passing through an area are considered to have lower viewer sensitivity because they often become accustomed (and indifferent) to the views along their travel routes because of repetition and short viewing duration.

WSDOT (Communication ID 473686)		
Comment ID	**Comment Text**	**Response**
5	The phrase “, or other features to help screen views…” should be spelled out more specifically or examples of what “other features” could be.	Section 3.7, Visual and Aesthetic Resources, of the 2023 Draft EIS was revised to state that views of the mainline and other project components would be screened through landscaping and aesthetic treatments. This update is reflected in the Final EIS. Aesthetic treatments may include, for example, concrete walls that have visually interesting elements, such as design treatments that incorporate textures, patterns, color, or climbing vines.
6	This paragraph is implying that RCA mitigation requirements are synonymous with vegetation replacement requirements per the WSDOT Roadside Policy Manual. They are not the same thing. Impact to RCAs cannot be mitigated in the same way as roadside vegetation is. The primary mitigation method for RCAs is avoidance of that impact. Restoration of roadside vegetation should be addressed separately from RCAs.	Section 3.7, Visual and Aesthetic Resources, of the 2023 Draft EIS clarifies the distinction between mitigation requirements for Resource Conservation Areas and other WSDOT roadside areas. This update is reflected in the Final EIS.
7	It seems that section 3.73 should have more description of the mitigation measures that are described in the visualizations. One thing that muddies the assessment of the long-term impact analysis is the assumption that the visualizations’ shown mitigation measures will be pursued. I think it makes more sense to show the before impact, the impact visualization and thein in the Potential Mitigation measures show the impact visualization with the mitigation measures.	Section 3.7, Visual and Aesthetic Resources, of the 2023 Draft EIS was revised to include a more detailed description of potential mitigation measures to distinguish elements of mitigation shown within each view. This update is reflected in this Final EIS.
8	The mitigation measures should be spelled out in more detail to align with the visualizations. The public will view this and think this is exactly how it will look. If the visualizations are just approximate, this needs to be spelled out in the document.	Section 3.7, Visual and Aesthetic Resources, of the 2023 Draft EIS and this Final EIS, explains that the simulations are conceptual, and the building, wall, and landscaping details would be determined in the final design phase. This section also includes a more detailed description of potential mitigation measures.
9	Add Land Acquisition per FWLE Land Exchange Agreement, by WSDOT	The suggested project approval has been added to the list of anticipated or potential licenses, permits, and approvals found in the Executive Summary of the 2023 Draft EIS. This update is reflected in the Final EIS.

WSDOT (Communication ID 473686)		
Comment ID	**Comment Text**	**Response**
10	Multiple figures in document show Midway Landfill Alternative "Potential Construction Limits" to edge of I-5 lanes. The WSDOT SR 509 Completion Project will likely be constructing work in the area between 2024 and 2028, so it is not likely that WSDOT will allow Sound Transit temporary use of the area from I-5 to the WSDOT Compatibility Line that exists on the east side of the FWLE guideway.	Sound Transit acknowledges the potential for overlapping construction schedules with the SR 509 Completion Project. If the Midway Landfill Alternative is selected to be built, Sound Transit would work with WSDOT regarding construction access and schedule coordination.
11	Figure 3.7-7 shows an aerial guideway at the Midway Landfill. Sound Transit is constructing a retained fill, at-grade guideway now, not an aerial guideway through the majority of the Midway Landfill.	The figure was revised in the 2023 Draft EIS to show the FWLE final design. This update is reflected in the Final EIS.
12	Table states that NEPA Environmental Review would occur, if necessary. It is our understanding a NEPA will occur for the preferred alternative. What is the scenario in which NEPA may not occur?	NEPA review is required for all the build alternatives, due in part to each alternative's location in the I-5 right-of-way. The Executive Summary of the 2023 Draft EIS was revised to explain this requirement. This update is reflected in the Final EIS
13	Given the upcoming state legislation, the HEAL Act, that will require consideration of impacts to EJ and vulnerable populations and the federal requirement through future NEPA, we urge the board to consider in their decision-making, the long term adverse impacts to historically disadvantaged groups. This seems like a difficult task given there is no analysis presented in this document. How will the board consider impacts to EJ communities in their decision-making? It appears that low-income mobile home residents who may be displaced in the Belmor development will not have comparable choices. As transportation professionals, we are seeking to do no further harm and begin to address past burdens on these groups – the S 336th and 344th alternatives do not seem to support this direction.	The legislation that enacted the HEAL Act does not apply to Sound Transit. However, Sound Transit conducted an environmental justice analysis, which is available in Final EIS Appendix E, Environmental Justice Assessment, and summarized in Section 3.6, Environmental Justice, Social Resources, Community Facilities, and Neighborhoods. Table E.5-1 in Appendix E summarizes potential impacts to environmental justice populations and the process through which Sound Transit would relocate displaced residents to comparable housing or better. The Sound Transit Board considered the analysis of alternatives, impacts, and potential mitigation measures contained in the 2021 SEPA Draft EIS; Tribal, agency, and public comments on the 2021 SEPA Draft EIS; and other information before identifying the Preferred Alternative. The Sound Transit Board will consider comments on the 2021 and 2023 Draft EISs, Final EIS analysis, and other factors before selecting the project to be built.

Re: King County Metro Transit's comments on the Sound Transit Operations and Maintenance Facility South Draft Environmental Impact Statement

Dear Mr. Rehmet:

Thank you for the opportunity to review and comment on the Sound Transit (ST) Operations and Maintenance Facility South (OMF-S) Draft Environmental Impact Statement (DEIS).

King County Metro (Metro) would like to thank Sound Transit for their continued leadership on providing regional transit service. As population growth and traffic congestion have continued to increase in the Puget Sound region, we recognize the need for transportation improvements that increase mobility options and support transit throughout the Puget Sound region.

Metro is primarily concerned with impacts to transit in the vicinity of the OMF-S project, regardless of alternative. All alternatives analyzed in the DEIS are near or adjacent to SR 99. Any use of SR 99 as a haul route during construction has the potential to impact Metro's operations along that corridor. The magnitude of work required for the Midway Landfill site alternative would likely have the greatest impact on Metro's operations.

Metro has the following comments on the ST OMF-S DEIS: Include transit specifically in the mitigation section under transportation and include transit in the construction transportation management plan.

The report should clarify how LOS is measured/defined for intersections under two-way stop control (TWSC). Since this is defined differently from signalized intersection LOS, the actual NB/SB thru traffic impacts at 246th should be noted in the DEIS to help fully understand why the Midway site alternative causes the delay/LOS at 246th to degrade.

The report should clarify potential construction truck traffic impacts at 272nd, Kent Des-Moines Rd, and the northbound HOV lane, as well as potential impacts of a truck acceleration/deceleration lane and/or any long-term mitigation at 246th (signalization, u-turns at 252nd, etc.) to the northbound HOV lane (pg. 3.2-42).

Going forward, Lori Burchett will continue to be the lead participant and main point of contact for Metro. John Greene will be responsible for Metro's internal coordination in support of its role as a Participating Agency during the SEPA environmental review process. Their contact information is as follows:

Lori Burchett
Transportation Planner

E: Lori.Burchett@kingcounty.gov

John Green
Senior Environmental Planner
King County Metro Transit
King Street Center
201 S. Jackson St., KSC-TR-0435
Seattle, WA 98104-3856
P: (206) 263-0506
E: JGreene@kingcounty.gov

Thank you for this opportunity to comment on the DEIS. The OMF-S will provide significant benefit to the regional transportation network and Metro will continue to work with Sound Transit in our role as a Consulted Agency. We believe that implementing the recommendations above will disclose important information needed to develop a balanced Preferred Alternative and to assist the public and decision-makers in selecting the best option.

We look forward to continuing our collaboration to achieve the best project for our shared customers across the region.

Sincerely,

DocuSigned by:

1	Metro is primarily concerned with impacts to transit in the vicinity of the OMF-S project, regardless of alternative. All alternatives analyzed in the DEIS are near or adjacent to SR 99. Any use of SR 99 as a haul route during construction has the potential to impact Metro's operations along that corridor. The magnitude of work required for the Midway Landfill site alternative would likely have the greatest impact on Metro's operation.	Section 3.2.2.3, Construction Impacts (Transportation), of the Final EIS, discusses impacts to roadways, including SR 99, from haul routes.
2	Include transit specifically in the mitigation section under transportation and include transit in the construction transportation management plan.	Avoidance and minimization measures concerning impacts to transit were added to Section 3.2, Transportation, of the 2023 Draft EIS. There are no mitigation measures proposed for transit impacts as OMF South is not anticipated to result in long-term operational impacts to transit. Up to 50 parking spaces in the Federal Way/S 320th Street Park & Ride would be removed as part of the Preferred and South 344th Street alternatives to accommodate the elevated mainline tracks and a relocated BPA transmission line tower. This update is reflected in the Final EIS.
3	The report should clarify how LOS is measured/defined for intersections under two-way stop control (TWSC). Since this is defined differently from signalized intersection LOS, the actual NB/SB thru traffic impacts at 246th should be noted in the DEIS to help fully understand why the Midway site alternative causes the delay/LOS at 246th to degrade.	A description of the criteria used to analyze traffic operations is available in Appendix G1, Transportation Technical Report, of the 2023 Draft EIS and this Final EIS, as are traffic counts and turning movements at the SR 99 and S 246th Street intersection. The analysis provides an explanation for the factors that contribute to the increased delay at SR 99 and S 246th Street.
4	The report should clarify potential construction truck traffic impacts at 272nd, Kent-Des Moines Rd, and the northbound HOV lane, as well as potential impacts of a truck acceleration/deceleration lane and/or any long-term mitigation at 246th (signalization, u-turns at 252nd, etc.) to the northbound HOV lane (pg. 3.2-42).	Each OMF South alternative was analyzed using the same type of data and methodology to allow for an equal comparison of alternatives, including an assessment of future truck trip volumes. Impacts resulting from truck traffic are described in Section 3.2.2.3, Construction Impacts, of the 2023 Draft EIS and this Final EIS.

Subject: DEIS Comments for the Operations and Maintenance Facility South Project

Dear Mr. Rehmat:

The City of Des Moines is pleased to provide our comments on the Draft Environmental Impact Statement (DEIS) for the Sound Transit Operations and Maintenance Facility South (OMFS) Project.

The City of Des Moines is committed to working with Sound Transit and the cities of Kent and Federal Way to ensure the OMFS supports Federal Way Link Extension and the expansion of light rail to Tacoma, balances local and regional interests, does not adversely affect Highline College or the neighborhoods in the South Des Moines/Midway area, does not compromise developing a vibrant KDM station area and business district along SR-99, minimizes impacts on existing businesses and residents, supports municipal services through maintenance and growth of sales and property taxes, and maintains the living, working and shopping convenience and livability of our respective Midway neighborhoods. Although estimated costs are highest for the Midway Landfill alternative, the City supports the productive reuse of the Midway Landfill site and that its use avoids impacts associated with the two Federal Way alternatives.

In summary, the comments on the DEIS for the OMFS at the Midway Landfill are as follows:

Transportation

- The traffic study to be developed should include LOS analysis during construction/hauling activities and post construction of the OMF for the following intersections along SR-99: Kent-Des Moines Road (KDM), College Way/S 236th, S 240th, S 260th and S 272nd.

- LOS analysis would identify any potential mitigation required at Des Moines intersections or affecting City of Des Moines streets.

The Waterland City

- Haul routes will need to be reviewed for potential mitigation and restoration.

- The traffic study should identify if any new PM peak hour trips are added to the Des Moines Street system.

Ecosystem and Water Resources

- If the Midway Landfill site is selected, include the City of Des Moines in the review of the Drainage Site Plan, Technical Information Report, and SWPPP.

- The City of Des Moines should also be identified as an affected agency for compliance review of the NPDES Stormwater Discharge Requirements.

- Reevaluate impacts from increased impervious surface to streams and stream buffers. The City does not understand the “0” for Stream and Stream Buffer impacts (pp. ES-18 and ES-27) for the Midway site given the amount of impervious surface being added.

Construction Impacts
The following impacts will need to be more fully developed or identified in the FEIS for the Midway site if it is selected as the preferred alternative:

- Construction timeline.

- Community/business impacts due to the estimated 570 truck trips/day over 4.5-5.5 year site preparation period.

- Potential human health risks to both construction workers, employees and community from potential release of contaminated air, soil or water.

- Unknown risks associated with the landfill/superfund site that could add additional time, and construction and O & M costs.

We look forward to our continued collaboration with Sound Transit. Please feel free to contact me or City staff if you have questions about our comments.

Sincerely,

Susan M. Cez

Susan Cezar LEG, Chief Strategic Officer
SEPA Official

City of Des Moines (Communication ID 473484)		
Comment ID	**Comment Text**	**Response**
1	Although estimated costs are highest for the Midway Landfill alternative, the City supports the productive reuse of the Midway Landfill site and that its use avoids impacts associated with the two Federal Way alternatives.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	In summary, the comments on the DEIS for the OMFS at the Midway Landfill are as follows: **Transportation** • The traffic study to be developed should include LOS analysis during construction/hauling activities and post construction of the OMF for the following intersections along SR-99: Kent-Des Moines Road (KDM), College Way/S 236th, S 240th, S 260th and S 272nd. • LOS analysis would identify any potential mitigation required at Des Moines intersections or affecting City of Des Moines streets. • Haul routes will need to be reviewed for potential mitigation and restoration. • The traffic study should identify if any new PM peak hour trips are added to the Des Moines Street system.	The LOS analysis for arterial and local streets included in Section 3.2, Transportation, of the 2023 Draft EIS and this Final EIS focused on locations assumed to be most likely affected in the long term by the project alternatives. The intersections that were analyzed are those directly affected, such as by a change in channelization or signal control resulting from new roadway configurations or those that would be affected by OMF South traffic volumes near each site. The intersections of SR 99 with S 240th Street and S 260th Street were included in the LOS analysis; the rest of the intersections listed in this comment fell outside the study area. Section 3.2, Transportation, identifies the potential haul routes and evaluates the potential impacts from anticipated construction traffic qualitatively against existing traffic volumes. As stated, the contractor would develop a construction transportation management plan to identify site access and hauling routes in coordination with the appropriate jurisdictions. Traffic volumes are forecast to increase throughout the study area during both the 2042 AM and PM peak hours because of planned population and employment growth by local jurisdictions. If OMF South were to be constructed at the Midway Landfill site, it could add additional trips to the Des Moines street system; however, the additional trips would be very minor in relation to background traffic growth and would not be anticipated to result in LOS impacts.
3	**Ecosystem and Water Resources** • If the Midway Landfill site is selected, include the City of Des Moines in the review of the Drainage Site Plan, Technical Information Report, and SWPPP. • The City of Des Moines should also be identified as an affected agency for compliance review of the NPDES Stormwater Discharge Requirements.	If the Midway Landfill Alternative is selected as the project to be built, Sound Transit would coordinate with the city of Des Moines for reviews of stormwater management documentation, such as the Drainage Site Plan, SWPPP, and NPDES compliance documentation.
4	• Reevaluate impacts from increased impervious surface to streams and stream buffers. The City does not understand the “0” for Stream and Stream Buffer impacts (pp. ES-18 and ES-27) for the Midway site given the amount of impervious surface being added.	The stream and stream buffer impacts reported in the Executive Summary refer to direct impacts to streams and buffer areas and not to indirect impacts, such as potential downstream effects through changes to impervious surfaces. Section 3.11, Water Resources, in the 2023 Draft EIS and this Final EIS discusses impacts related to impervious surfaces.

City of Des Moines (Communication ID 473484)		
Comment ID	**Comment Text**	**Response**
5	**Construction Impacts** The following impacts will need to be more fully developed or identified in the FEIS for the Midway site if it is selected as the preferred alternative: - Construction timeline. - Community/business impacts due to the estimated 570 truck trips/day over 4.5-5.5 year site preparation period.	The Sound Transit Board identified the South 336th Street Alternative as the Preferred Alternative. The Final EIS addresses construction impacts related to the Midway Landfill Alternative throughout the document. Impacts associated with construction are discussed for each element of the environment. Specifically, construction impacts to communities are discussed in the 2023 Draft EIS and this Final EIS in Section 3.6, Environmental Justice, Social Resources, Community Facilities, and Neighborhoods. Construction impacts to businesses are discussed in Section 3.3, Acquisitions, Displacements, and Relocations, and Section 3.5, Economics.
6	- Potential human health risks to both construction workers, employees and community from potential release of contaminated air, soil or water. - Unknown risks associated with the landfill/superfund site that could add additional time, and construction and O & M costs.	Possible risks from potential release of contaminated air, soil, or water are described in the 2023 Draft EIS and this Final EIS in Section 3.13, Hazardous Materials. Additionally, in the Executive Summary, under Areas of Controversy and Issues to be Revolved, potential risks associated with developing the Midway Landfill are described.

RE: Sound Transit Light Rail Operations and Maintenance Facility – South Draft Environmental Impact Statement Comments

Dear Mr. Rehmat:

Thank you for the opportunity to provide comments on the Draft Environmental Impact Statement (DEIS) for the Sound Transit (ST) Light Rail Operations and Maintenance Facility – South (OMF-S) and applicable appendices.

As previously stated by the City of Kent, the City of Kent does not object to the OMF-S facility being located within the city provided the OMF-S is constructed on the Midway Landfill site. The city provides the comments below on the three alternatives being analyzed in the DEIS.

Figure ES-8 – Illustrated Metrics: Preliminary Capital and Operating Costs Estimates - Why the increased annual cost annual operation at the Midway Landfill compared to the other two sites? A 10% increase in costs at the Midway Landfill site should be explained. This has not been identified in the DEIS and the public should be provided an opportunity to comment the increased maintenance cost.

Sec. 1.1 – Purpose of the Project - The purpose and need should identify which ST expansion projects requires the construction of the OMF-S facility. Is the OMF-S facility needed for the Federal Way Link Extension (FWLE) project? A portion of the FWLE project is funded with ST3 funds.

Sec. 2.6 – Funding and Conceptual Cost Estimates - The DEIS identifies conceptual cost estimates that that vary greatly between the Midway Landfill site and the other sites being considered. A detailed breakdown of the assumed costs associated with each alternative should be included in the DEIS to fully understand the alternatives being considered.

Sec. 2.7.2 – Next Steps and Schedule: Benefits and Disadvantages of Delaying Project Implementation - The FWLE project was extended as a part of ST3. Would the delay of the OMF-S impact the level of service anticipated once the FWLE project was completed?

Sec 3.2.1.2 – Transportation: Impact Thresholds– The City of Kent does not agree with the mitigation threshold of +10 seconds. Mitigation may be required based on a lower delay threshold.

Sec 3.2.1.2 – Transportation: Impact Thresholds– The second paragraph needs to be clarified. Is the mitigation threshold LOS E for SR 99 and LOS F for the other streets that are not HSS or state highways?

Sec 3.2.1.2 – Transportation: Impact Thresholds– The City of Kent's current (2021) Transportation Master Plan LOS for SR 99 is LOS D or better.

Sec 3.2.1.4 – Transportation: Transit – Metro Route 166 was eliminated in September 2020. Portions of the route are now served by Route 165.

Sec 3.2.2.1 – Transportation: Environmental Impacts - Kent's future transportation projects have changed with the adoption of the new Transportation Master Plan located at https://www.kentwa.gov/city-hall/public-works/transportation-and-streets/transportation-planning. Please review and revise as necessary.

Sec. 3.2.2.1 – Transportation: Environmental Impacts - Due to the impacts of construction on local streets, if the Midway Landfill site is selected for the OMF-S, South 259th Street will require a full width overlay.

Sec. 3.2.2.1. – Transportation: Environmental Impacts, Non-Motorized Network - The updated Transportation Master Plan (TMP), adopted in March 2021, details bicycle and pedestrian standards for Kent's transportation network. Below bicycle and pedestrian standards for the roadways in the Midway Landfill Study Area. For the more details on these standards, please see chapter 5 of the TMP located at https://www.kentwa.gov/home/showpublisheddocument?id=16632.

- SR 99 – S 240th St to 1st driveway south of 244th St
    - Bicycle – LOS 1
    - Pedestrian – Downtown/TOD Standard
- SR 99 – 1st driveway south of 244th St to S 259th St
    - Bicycle – LOS 1
    - Pedestrian – Areas of High Pedestrian Activity
- S 259th St – SR 99 to West Hill Mobile Manor Driveway
    - Bicycle – LOS 1
    - Pedestrian – Areas of High Pedestrian Activity
- S 259th St – West Hill Mobile Manor Driveway to east study limits
    - Bicycle – LOS 1
    - Pedestrian – Other Arterials
- S 240th St – All in study area
    - Bicycle – LOS 2
    - Pedestrian - Downtown/TOD Standard
- S 252nd St from SR 99 to 29th Ave S; 29th Ave S from S 252nd St to S 259th St; S 244th from SR 99 to just west of I-5; and new facility just west of I-5 between S 240th and S 244th St
    - Bicycle – LOS 2

Sec 3.2.2.2 – Transportation: Environmental Impacts, "Intersections" #2 (SR 99/S 244th St), #3 (SR 99/Midway Mobile Home Park), and #4 (S 246th St) are commercial driveways on the east side of SR 99 and do not need to be analyzed as intersections unless there is a direct impact on a public right-of-way intersection on the west side.

Sec 3.2.2.2. – Transportation: Environmental, Long Term Impacts - The location of the gates will need to be designed so expected queues do not extend into the public right of way assuming the likely usage and an additional safety factor.

Sec 3.2.2.2 - Transportation: Environmental, Long Term Impacts, Parking: Kent City Code 15.15.310 requires the following: *In order to provide adequate off-street parking, the lead agency for an HCT facility shall be required to provide a parking study, prepared as part of an EIS or separately, for each station, demonstrating that the parking demand will be satisfied.* This standard would apply to the OMF-S facility. Please indicate when this requirement would be fulfilled.

Sec. 3.2.2.3 – Transportation: Construction Impacts – Given the peak number of construction vehicles per day for the Midway Landfill alternatives, particularly the hybrid and full excavation alternatives, consultation with the Washington State Department of Transportation should be completed to consider options to access directly to I-5 similar to access during the landfill waste removal during the construction of the FWLE. Just north of the existing stormwater pond on the Midway Landfill, Structure B of the FWLE project has enough vertical separation to allow trucks to pass underneath and access I-5.

Figure 3.2-8 – Existing Annual Average Daily Traffic Along Truck Routes: Midway Landfill Alternative - This figure identifies the proposed haul route for the Midway Landfill Alternative. Considerable truck traffic is proposed. If a Midway Landfill option is chosen, will be required to complete a 2-inch minimum overlay on all haul routes within Kent's jurisdiction. In addition, a direct I-5 connection should be considered, particularly for the hybrid and full excavation options. Structure B within the FWLE project, just north of the Midway Landfill will be elevated enough to allow for a future road, therefore an alternative to access I-5 can be evaluated.

Sec. 3.3.2.3 – Construction Impacts – Temporary Construction Easements (TCEs) should be identified in the DEIS on a map. How will these TCEs impact traffic volumes and access to city streets. These need to be considered in the analysis.

Sec. 3.4.1.1 – Land Use: Affected Environment, Midway Landfill Alternative - The Midway Landfill would eliminate some commercial businesses along Pacific Highway South which are also shown on Figure 3.4-1. These commercial businesses should be discussed and specifically identified section 3.4.1.1.

Sec. 3.4.2 – Land Use: Consistency with Regional and Local Comprehensive Plans and Zoning - This type of facility is anticipated in KCC 15.04.060, allowed via a conditional use permit (CUP), and so would not be a fundamentally inconsistent land use. Any design-specific impacts would need to be mitigated as part of the CUP approval.

Sec. 3.4.3.3 – Land Use: Construction Impacts – The DEIS estimates a Midway Landfill alternative would take up to 8 years to complete. What is the degree of uncertainly in these estimates? How would the construction duration impact residents to the south, adjacent to S. 259th Street?

Table 3.5-5 – Economics: Property Acquisition Impacts on Businesses and Employees - This table identifies the four (4) businesses that would be displaced, with ten (10) total businesses affected. Please provide a complete list of the business names impacted for the Midway Landfill Site options.

Table 3.5-5 – Economics: Property Acquisition Impacts on Businesses and Employees - For this table Note 3 states employee displacements are based on building size and business type. The

number of businesses where employees could be displaced are not that great the actual number can be identified. Numbers on the table appear to be absolute and not necessarily representative of the actual number of displacements.

Sec. 3.6.2.3 – Social Resources, Community Facilities, and Neighborhoods: Construction Impacts - The Midway Landfill Alternative might also impact the residential properties along the southern edge of the Midway Landfill. Provide a description of how these properties would be impacted, particularly since options at the Midway Landfill could take up to eight years for construction.

Table 4.5-1 – Past, Present, and Reasonably Foreseeable Future Actions and Figure 4.5-1 – Past, Present, and Reasonably Foreseeable Future Actions -
Both the WSDOT SR509 (Map ID #1) and ST FWLE (Map ID#2) are long linear projects. As depicted on Figure 4.5-1. These projects should be clearly illustrated on the map.

GENERAL COMMENT - OMF-S appears to be larger than the Forrest Street OMF and the OMF-E. The alternatives in the DEIS appear to have expanded since earlier discussions with ST. Has the size of the OMF-S expanded and if so, please provide an explanation of why the expansion has occurred? If there is expansion, how much of the expansion is intended for the expansion of light rail north of Seattle?

GENERAL COMMENT – Many assumptions were made with each of the alternatives. A complete list of assumptions for each site alternative should be provided for the public and decision makers to review and understand during the comment period.

Appendix C - OMF-S DEIS Conceptual Design Drawings

Midway Landfill Option 2 – Hybrid (Sheet 5) vs. Midway Landfill Option 3 Total excavation. Why include deep dynamic compaction in Option 2 sheet 5? Based on the cross section for the hybrid option, why add deep dynamic compaction when the full excavation option does calls out 3-foot over excavation from the 1966 topography? Otherwise these are similar from an excavation perspective. Can the deep dynamic compaction be eliminated for a cost savings and/or a reduced construction time?

As required by Kent City Code section 15.15.020, the design requirements of KCC 15.15 shall apply to this site. An analysis of the site requirements from this section should be included.

Appendix D2 Interim Midway Landfill Preparation Memorandum

Sec. 2.1 - Earthwork Process, page 14, Line 16 states the active excavation and hauling are assumed to be 12-hour shifts but may be 16-hours with two shifts. Is the construction duration for these alternatives based on a 12-hour shifts or 16-hour shifts? Both should be represented in the DEIS. Would 16-hour shifts decrease construction costs? Also, what would the reduction in the construction duration be with 16-hour shifts?

Sec. 2.1 - Earthwork Process, page 14, Line 20 states excavation is assumed to be permitted only between May 1 and September 30. This is a significant assumption. This would have significant impact on construction duration and the cost of construction. Which agency makes this final determination and how can this be resolved prior to the decision making by the Sound Transit Board?

Sec. 2.2 - Drilled Shaft and Slab Installation, Page 14 line 36 states that drilled shafts are assumed to be 10-feet in diameter. These are quite large shafts and potentially very expensive. This is a significant assumption. Are these the largest shafts that would be required? What is the difference in cost and construction duration if the columns were a smaller diameter? What information is needed to the determine if smaller diameter shafts could be used and what are the cost savings? How can this be determined to refine potential construction costs prior to decision making by the Sound Transit Board?

Sec. 2.5 - Construction Phasing and Material Reuse, page 18, line 27 assumes a 5-acre open refuse area that will be limiting for space demands. How was the 5-acre open refuse area assumed and who makes that final determination? This might be able to be larger. Which agency makes this final determination and how can this be resolved prior to the decision making by the Sound Transit Board? If this can be larger, is there a potential reduction in cost and construction duration for Midway Landfill alternatives?

Sec. 4.0 - Schedule, Page 33, Line 22, second schedule consideration states there may be an advantage to separating out. A description of the advantage should be included in the analysis.

Appendix D3 Conceptual Landfill Refuse Plan

Sec. 2.6.1 – Why is deep dynamic compaction proposed for the hybrid option but not the full excavation option when material will be removed and reused? See Figures 2 and 3.

Sec. 2.6.2.2 - Drilled Shaft and Slab Installation, Page 26, Line 8 states that the grid spacing for the drilled shafts changed from the 100-ft by 100-ft spacing due to land landfill optimization process. Line 2 identifies a 35-foot by 70-foot grid. What information led to this change and what is the impact to construction cost and duration?

Sec. 2.6.2.3 – Environment Considerations During Construction, Page 30, Line 22 discusses re-use of screened soils from the landfill. How and when will this information be determined? This could have an impact on the cost and duration of construction.
Sec. 2.6.3.1 – Truck Haul Routes – Are construction haul routes described in the documents for waste removal or all construction vehicles? Specifically, if the Midway Landfill site is selected, and concrete trucks are locally sourced, what is the route for the concrete trucks? City streets included in the haul routes for concrete trucks should receive an overlay at the conclusion of the project.
Sec. 2.6.3.2 – Level of Service – If the Midway Landfill site is selected, and concrete trucks are locally sourced, how will the quantity of the concrete trucks impact traffic patterns? Does the data in Table 2-5 include concrete trucks?
Appendix D4 Midway Landfill Human Health Risk Assessment

GENERAL QUESTION - For Contaminants of Interest, are there any potential mitigation measures that can be implemented during construction to mitigate any potential human health risks for all options at the Midway Landfill site?
Appendix G1 - OMF-S DEIS – Transportation Technical Report

Sec. 4.1.1.1 – Please updates with Kent's current Transportation Master Plan.

Sec 4.1.x – "Intersections" #2 (SR 99/S 244th St), #3 (SR 99/Midway Mobile Home Park), and #4 (S 246th St) are commercial driveways on the east side of SR 99 and do not need to be analyzed as intersections unless there is a direct impact on a public right-of-way intersection on the west side.

Sec 4.2.1.x – The location of the gates will need to be designed so expected queues do not extend into the public right of way assuming the likely usage and an additional safety factor.

Sec 4.2.1.5 – Why would parking be lost on S 252nd St.? The project would be required to construct standard frontage improvements which may include width for on-street parking.

Sec 4.2.2.1 – Converting the median to a southbound left-turn in the 24600 block will require WSDOT approval (RCW 46.61.020 (13)). Kent will require mitigation for the lost landscaping in the median.

Sec 4.6.1 – With this much truck traffic, S 272nd St. will need post-construction restoration.

Potential Funding Resources

The March 2021 *Center for Creative Land Recycling* newsletter included some articles that may be a resource for funding or resources that could be used should the Midway Landfill site be selected. The website for the *Center For Creative Land Recycling* can be found at https://www.cclr.org/. Also, the articles in the March 2021 Newsletter are listed below:

1) Vision to Action: Engaging Communities for Better Redevelopment - https://www.cclr.org/sites/default/files/V2A%20Fact%20Sheet%20%2B%20Case%20Studies%20%283%29.pdf
2) Real Estate Technical Assistance Opportunity - https://www.cclr.org/cre-technical-assistance?mc_cid=01cd720724&mc_eid=b4c1148da3
3) Targeted Brownfields Assessment Request in Region 10 (EPA) - https://www.epa.gov/brownfields/targeted-brownfields-assessment-requests-region-10?mc_cid=01cd720724&mc_eid=b4c1148da3
4) Power Up Your Program:
   Using the Brownfields Community Capacity Assessment Tool Webinar - https://www.ksutab.org/education/webinars/details?id=452&mc_cid=01cd720724&mc_eid=b4c1148da3

Thank you again for the opportunity to comment on Draft Environmental Impact Statement for the proposed Operation and Maintenance Facility-South.

Sincerely,

Kurt Hanson
Economic and Community Development Director

c: Dana Ralph, Mayor
Derek Matheson, Chief Administrative Officer
Chad Bieren, P.E., Public Works Director
Matt Gilbert, Economic and Community Development Manager
Kelly Peterson, City of Kent Liaison to Sound Transit – FWLE

City of Kent (Communications ID 473482)		
Comment ID	**Comment Text**	**Response**
1	As previously stated by the City of Kent, the City of Kent does not object to the OMF-S facility being located within the city provided the OMF-S is constructed on the Midway Landfill site. The city provides the comments below on the three alternatives being analyzed in the DEIS. Figure ES-8 - Illustrated Metrics: Preliminary Capital and Operating Costs Estimates - Why the increased annual cost operation at the Midway Landfill compared to the other two sites? A 10% increase in costs at the Midway Landfill should be explained. This has not been identified in the DEIS and the public should be provided an opportunity to comment on the increased maintenance cost.	The additional $1M in annual operations and maintenance costs for the Midway Landfill is discussed in the 2023 Draft EIS and this Final EIS in the Executive Summary and Section 2.5, Funding and Opinion of Probable Cost. The additional annual expenses are expected to be necessary to mitigate for potential risks posed by settlement and methane gas over the lifespan of the facility as well as higher operating costs for the trains to deploy each morning before passenger service begins and return to the OMF each night after passenger service has shut down.
2	Sec. 1.1 - Purpose of the Project - The purpose and need should identify which ST expansion projects requires the construction of the OMF-S facility. Is the OMF-S facility needed for the Federal Way Link Extension (FWLE) project? A portion of the FWLE is funded with ST3 funds.	Chapter 1, Purpose and Need for the Project, in the 2023 Draft EIS and this Final EIS explains that OMF South would be built in the South Corridor to maintain and store a portion of the light rail vehicle (LRV) fleet for the Sound Transit 3 system expansion as well as to receive, test, commission, store, maintain, and deploy new LRVs for the entire system.
3	Sec. 2.6 - Funding and Conceptual Cost Estimates - The DEIS identifies conceptual cost estimates that that vary greatly between the Midway Landfill site and the other sites being considered. A detailed breakdown of the assumed costs associated with each alternative should be included in the DEIS to fully understand the alternatives being considered.	The purpose of the EIS process is to identify the potential impacts to the natural and built environment. The cost estimates were included for comparison purposes. A detailed cost breakdown is not included in the Final EIS.
4	Sec 2.7.2 - Next Steps and Schedule: Benefits and Disadvantages of Delaying Project Implementation - The FWLE project was extended as part of ST3. Would the delay of the OMF-S impact the level of service anticipated once the FWLE project was completed?	FWLE was included in Sound Transit 2, with additional funding provided by Sound Transit 3. A delay of OMF South would not affect the completion of FWLE or affect the FWLE level of service.

City of Kent (Communications ID 473482)		
Comment ID	**Comment Text**	**Response**
5	Sec 3.2.1.2 - Transportation: Impact Thresholds - The City of Kent does not agree with the mitigation threshold of +10 seconds. Mitigation may be required based on a lower delay threshold. Sec 3.2.1.2 - Transportation: Impact Thresholds - The second paragraph needs to be clarified. Is the mitigation threshold for LOS E for SR 99 and LOS F for the other streets that are not HSS or state highways? Sec 3.2.1.2 - Transportation: Impact Thresholds - The City of Kent's current (2021) Transportation Master Plan LOS for SR 99 is LOS D or better.	Sound Transit typically uses a 10-second or 10-percent additional delay threshold when determining whether mitigation is needed for intersections already operating at LOS F. This threshold is used because it represents the conditions when there would start to be a noticeable vehicle delay increase compared with the No-Build Alternative. Section 3.2, Transportation, in the 2023 Draft EIS and this Final EIS clarifies the LOS standards for WSDOT, Federal Way, and Kent and notes that Kent follows the WSDOT LOS standard for SR 99, which is D or better.
6	Sec 3.2.1.4 - Transportation: Transit - Metro Route 166 was eliminated in September 2020. Portions of the route are now served by Route 165.	This information was updated in Section 3.2, Transportation, in the 2023 Draft EIS and is reflected in this Final EIS.
7	Sec. 3.2.2.1 - Transportation: Environmental Impacts - Kent's future transportation projects have changed with the adoption of the new Transportation Master Plan located at https://www.kentwa.gov/city-hall/public-works/transportation-and-streets/transportation-planning. Please review and revise as necessary.	The list of projects planned by the City of Kent was updated in Section 3.2, Transportation, in the 2023 Draft EIS. This update is reflected in the Final EIS.
8	Sec 3.2.2.1 - Transportation: Environmental Impacts - Due to the impacts of construction on local streets, if the Midway Landfill site is selected for the OMF-S, South 259th Street will require a full width overlay.	Should the Midway Landfill Alternative be selected as the project to be built after publication of the Final EIS, Sound Transit would identify haul routes as part of its traffic management plan and comply with mitigation measures as required by the Kent City Code.

City of Kent (Communications ID 473482)		
Comment ID	**Comment Text**	**Response**
9	Sec. 3.2.2.1. - Transportation: Environmental Impacts, Non-Motorized Network - The updated Transportation Master Plan (TMP), adopted March 2021, details bicycle and pedestrian standards for Kent's transportation network. Below bicycle and pedestrian standards for the roadways in the Midway Landfill Study area. For more details on these standards, please see chapter 5 of the TMP located at https://kentwa.gov/home/showpublisheddocument?id=16632. • SR-99 - South 240th St to 1st driveway south of 244th St ○ Bicycle - LOS 1 ○ Pedestrian - Downtown/TOD Standard • SR-99 - 1st driveway south of 244th St to S 259th St ○ Bicycle - LOS 1 ○ Pedestrian - Areas of High Pedestrian Activity • S 259th St - SR 99 to West Hill Mobile Manor Driveway ○ Bicycle - LOS 1 ○ Pedestrian - Areas of High Pedestrian Activity • S 259th St - West Hill Mobile Manor Driveway to east study limits ○ Bicycle - LOS 1 ○ Pedestrian - Other arterials • S 240th St - All in study area ○ Bicycle - LOS 2 ○ Pedestrian - Downtown/TOD Standard • S 252nd St from SR 99 to 29th Ave S; 29th Ave S from 252nd St to S 259th S; S 244th from SR 99 to just west of I-5; and new facility just west of I-5 between S 240th and S 244th St ○ Bicycle- LOS 2	Appendix G1, Transportation Technical Report, of the 2023 Draft EIS and this Final EIS includes the LOS standards for nonmotorized facilities in the study area.
10	Sec 3.2.2.2 - Transportation: Environmental Impacts, "Intersections" #2 (SR 99/S 244th St), #3 (SR 99/Midway Mobile Home Park), and #4 (S 246th St) are commercial driveways on the east side of SR 99 and do not need to be analyzed as intersections unless there is a direct impact on a public right-of-way intersection on the west side.	These intersections were included for analysis early in the project to accommodate potential design changes. Based on the city's comments, Sound Transit removed analysis of these intersections from the text of Section 3.1, Transportation, of the 2023 Draft EIS, but kept the analysis of them in Appendix G1, Transportation Technical Report. This update is reflected in this Final EIS.

City of Kent (Communications ID 473482)		
Comment ID	**Comment Text**	**Response**
11	Sec 3.2.2.2. - Transportation: Environmental, Long Term Impacts - The location of the gates will need to be designed so expected queues do not extend into the public right of way assuming the likely usage and an additional safety factor.	As stated in Section 3.2.2.2 of the 2023 Draft EIS and this Final EIS, the access driveways and gate locations along driveways should allow for sufficient capacity to accommodate the inbound and outbound vehicles trips without additional queueing and delays that would impact intersection operations. While driveway space would be able to accommodate some number of vehicles, queues during peak hours could extend into the public right-of-way. Sound Transit will continue to revise the design to accommodate vehicle queues within the entrance driveway to the extent possible.
12	Sec. 3.2.2.2 - Transportation: Environmental, Long Term Impacts, Parking: Kent City Code 15.15.310 requires the following: *In order to provide adequate off-street parking, the lead agency for an HCT facility shall be required to provide a parking study, prepared as part of an EIS or separately, for each station, demonstrating that the parking demand will be satisfied.* This standard would apply to the OMF-S facility, Please indicate when this requirement would be fulfilled.	The OMF South project does not include a station. OMF South would be designed to accommodate the number of employees and visitors and to comply with the parking requirements of local jurisdictions. Section 4.2.1.5 of Appendix G1, Transportation Technical Report, of the Draft 2023 and this Final EIS discusses the parking assumptions for each alternative.
13	Sec. 3.2.2.3 - Transportation: Construction Impacts - Given the peak number of construction vehicles per day for the Midway Landfill alternatives, particularly the hybrid and full excavation alternatives, consultation with the Washington State Department of Transportation should be completed to consider options to access directly to I-5 similar to access during the landfill waste removal during the construction of the FWLE. Just north of the existing stormwater pond on the Midway Landfill, Structure B of the FWLE project has enough vertical separation to allow trucks to pass underneath and access I-5.	Should the Midway Landfill Alternative be selected as the project to be built after publication of the Final EIS, Sound Transit would consult with WSDOT on the possibility of direct access to I-5. Since the landfill is to the west of I-5, direct access could only be to southbound I-5 and would be constrained by the newly built FWLE facilities. This would only be a consideration if the excavated waste were to be hauled to a transfer facility south of the landfill.
14	Figure 3.2-8 - Existing Annual Average Daily Traffic Along Truck Routes: Midway Landfill Alternative - This figure identifies the proposed haul route for the Midway Landfill Alternative. Considerable traffic is proposed. If a Midway Landfill option is chosen, it will be required to complete a 2-inch minimum overlay on all haul routes within Kent's jurisdiction. In addition, a direct I-5 connection should be considered, particularly for the hybrid and full excavation options. Structure B within the FWLE project, just north of the Midway Landfill will be elevation enough to allow for a future road, therefore an alternative to access I-5 can be evaluated.	Should the Midway Landfill Alternative be selected as the project to be built after publication of the Final EIS, Sound Transit would identify haul routes as part of its traffic management plan and comply with mitigation measures as required by the Kent City Code. As stated in Section 3.2, Transportation, of the 2023 Draft EIS and this Final EIS Sound Transit would consult with WSDOT on the possibility of direct access to I-5.

City of Kent (Communications ID 473482)		
Comment ID	**Comment Text**	**Response**
15	Sec. 3.3.2.3 - Construction Impacts - Temporary Construction Easements (TCEs) should be identified in the DEIS on a map. How will these TCEs impact traffic volumes and access to city streets. These need to be considered in the analysis.	Due to the conceptual level of design, temporary construction easements are not identified in the EIS. Temporary construction easements would be determined during final design. The discussion of impacts to traffic volumes and access to city streets encompasses broadly anticipated impacts from temporary construction easements in addition to permanent acquisitions.
16	Sec 3.4.1.1 - Land Use: Affected Environment, Midway Landfill Alternative - The Midway Landfill would eliminate some commercial businesses along Pacific Highway South with are also shown on Figure 3.4-1. These commercial businesses should be discussed and specifically identified section 3.4.1.1.	The potential impacts to properties and businesses are based on a conceptual level of design. Potentially affected parcels are listed in Appendix H, Supporting Information for Other Technical Analyses. The Final EIS does not list individual businesses; it identifies the number of business displacements for each alternative for comparison of impacts between alternatives. The number of estimated business displacements is listed in Section 3.5, Economics, of the 2023 Draft EIS and this Final EIS. Additionally, Section 3.4, Land Use, identifies the impacts to commercial land uses within the Midway Landfill site.
17	Sec. 3.4.2 - Land Use: Consistency with Regional and Local Comprehensive Plans and Zoning - This type of facility is anticipated in KCC 15.04.060, allowed via a conditional use permit (CUP), and so would not be fundamentally inconsistent land use. Any design-specific impacts would need to be mitigated as part of the CUP approval.	Section 3.4.2, Consistency with Regional and Local Comprehensive Plans and Zoning, of the 2023 Draft EIS was updated in response to this comment. This update is reflected in this Final EIS. Design-specific details associated with permit submittals will be developed during the final design phase that follows the publication of the Final EIS.
18	Sec. 3.4.3.3 - Land Use: Construction Impacts - The DEIS estimates a Midway Landfill alternative would take up to 8 years to complete. What is the degree of uncertainly in these estimates? How would the construction duration impact residents to the south, adjacent to S. 259th Street?	The project schedule for the Midway Landfill Alternative reflected in the 2023 Draft EIS and this Final EIS is based on a conceptual level of design. If the Board selects the Midway Landfill Alternative as the project to be built, Sound Transit would update the project schedule as the design progressed. Please see Sections 3.2, Transportation and 3.6, Environmental Justice, Social Resources, Community Facilities, and Neighborhoods in this Final EIS for information about the potential construction and long-term impacts of the Midway Landfill Alternative to adjacent residents.
19	Table 3.5-5 – Economics: Property Acquisition Impacts on Businesses and Employees – This table identifies the four (4) businesses that would be displaced, with ten (10) total businesses affected. Please provide a complete list of the business names impacted for the Midway Landfill Site options.	The potential impacts to properties and businesses are based on a conceptual level of design. The nature of the impacted businesses is discussed in the 2023 Draft EIS and this Final EIS in Section 3.5, Economics, and the property parcels anticipated to be impacted are shown in Appendix H1, Potentially Affected Parcels. The analysis includes the number of impacted businesses by alternative for comparison of potential impacts between the alternatives.

City of Kent (Communications ID 473482)		
Comment ID	**Comment Text**	**Response**
20	Table 3.5-5 – Economics: Property Acquisition Impacts on Businesses and Employees – For this table Note 3 states employee displacements are based on building size and business type. The number of businesses where employees could be displaced are not that great the actual number can be identified. Numbers on the table appear to be absolute and not necessarily representative of the actual number of displacements.	The number of displaced employees is based on the business building size (taken from King County Department of Assessment data) and the type of business activity using square-foot-per-employee factors from the U.S. Department of Energy and the Institute for Transportation Engineers. While not an actual survey of businesses, it allows an equal comparison between alternatives, which is the intent of an EIS.
21	Sec. 3.6.2.3 – Social Resources, Community Facilities, and Neighborhoods: Construction Impacts – The Midway Landfill alternative might also impact the residential properties along the southern edge of the Midway Landfill. Provide a description of how these properties would be impacted, particularly since options at the Midway Landfill could take up to eight years for construction.	Section 3.6.2.3 in the 2023 Draft EIS and this Final EIS describes construction impacts to neighborhoods in proximity to the Midway Landfill Alternative under the subheading Impacts Common to All Build Alternatives. The impacts include access and mobility restrictions, increased truck traffic, localized adverse impacts to air and visual quality, and increased noise and vibration.
22	Table 4.5-1 – Past, Present and Reasonably Foreseeable Future Actions and Figure 4.5-1 – Past, Present and Reasonably Foreseeable Future Actions – Both the WSDOT SR509 Map (Map ID #1) and ST FWLE (MAP ID #2) are long linear projects. As depicted in Figure 4.5-1. These projects should be clearly illustrated on the map.	The figures in Chapter 4, Cumulative Effects Analysis, of the 2023 Draft EIS were reconfigured to address this comment. Figure 4.3-1 now shows the extent of the SR 509 and FWLE project corridors as they relate to the OMF South Midway Landfill Alternative. Figure 4.3-2 shows the location of the remainder of the projects discussed in the analysis. This update is reflected in the Final EIS.
23	GENERAL COMMENT – OMF-S appears to be larger than the Forrest Street OMF and the OMF-E. The alternatives in the DEIS appear to have expanded since earlier discussions with ST. Has the size of the OMF-S expanded and if so, please provided an explanation of why the expansion has occurred? If there is an expansion, how much of the expansion is intended for the expansion of light rail north of Seattle?	At the beginning of the site identification process, it appeared that a site of 40 to 50 acres would be large enough to meet the needs of OMF South based on a typical OMF layout template. However, as project development continued and the programming requirements of OMF South were more fully refined, it became apparent that larger sites were necessary to accommodate site circulation, site access, space for frontage improvements and building setback requirements, and variation in parcel sizes. In addition, more space was needed for repair and daily cleaning of the higher-capacity LRVs required to serve system-wide ridership growth. See Section 2.2, Alternative Development and Scoping, in the 2023 Draft EIS and this Final EIS for more detail.
24	GENERAL COMMENT – Many assumptions were made with each of the alternatives. A complete list of assumptions for each site alternative should be provided for the public and decision makers to review and understand during the comment period.	The assumptions concerning the design and construction of each alternative are discussed throughout the EIS as needed to understand and estimate the potential impacts under each element of the environment.

City of Kent (Communications ID 473482)		
Comment ID	**Comment Text**	**Response**
25	Appendix C - OMF-S DEIS Conceptual Design Drawings Midway Landfill Option 2 - Hybrid (Sheet 5) vs. Midway Landfill Option 3 Total excavation. Why include deep dynamic compaction in Option 2 sheet 5? Based on the cross section for the hybrid option, why add deep dynamic compaction when the full excavation option does calls out 3-foot over excavation from the 1966 topography? Otherwise these are similar from an excavation perspective. Can the deep dynamic compaction be eliminated for a cost savings and/or a reduced construction time?	Deep dynamic compaction or some other form of stabilization would likely be necessary for the Hybrid subsurface design option because a portion of the landfill would be left in place. The supporting documents in Appendix D were written early in the conceptual design process. The assumptions made were purposefully conservative to account for unknowns. If the Board selects the Midway Landfill Alternative as the project to be built, Sound Transit would conduct further studies to refine construction requirements.
26	As required by Kent City Code section 15.15.020, the design requirements of KCC 15.15 shall apply to this site. An analysis of the site requirements from this section should be included.	Section 3.4., Land Use, of the 2023 Draft EIS and this Final EIS notes that the OMF would need to comply with Kent City Code Chapter 15.15, which includes design requirements to ensure that high-capacity transit facilities are well designed.
27	Appendix D2 Interim Midway Landfill Preparation Memorandum Sec, 2.1 - Earthwork Process, page14, Line 16 states the active excavation and hauling are assumed to be 12-hour shifts but may be 16-hours with two shifts. Is the construction duration for these alternatives based on a 12-hour shifts or 16-hour shifts? Both should be represented in the DEIS. Would 16-hour shifts decrease construction costs? Also, what would the reduction in the construction duration be with 16-hour shifts?	The construction durations assume 12-hour shifts. The supporting documents in Appendix D were written early in the conceptual design process. The assumptions made were purposefully conservative to account for unknowns. If the Board selects the Midway Landfill Alternative as the project to be built, Sound Transit would conduct further studies to refine construction requirements.
28	Sec. 2.1 - Earthwork Process, page14, Line 20 states excavation is assumed to be permitted only between May 1 and September 30. This is a significant assumption. This would have significant impact on construction duration and the cost of construction. Which agency makes this final determination and how can this be resolved prior to the decision making by the Sound Transit Board?	The supporting documents in Appendix D were written early in the conceptual design process. The assumptions made were purposefully conservative to account for unknowns. The construction window was assumed to be limited to the 22-week dry season between May 1 and September 30 to reduce the amount of precipitation that could potentially infiltrate into the open area of the landfill, which could further contribute to contaminated groundwater. If the Board selects the Midway Landfill Alternative as the project to be built, Sound Transit would conduct further studies to refine construction requirements.

City of Kent (Communications ID 473482)		
Comment ID	**Comment Text**	**Response**
29	Sec.2.2 - Drilled Shaft and Slab Installation, Page 14 line 36 states that drilled shafts are assumed to be 10-feet in diameter. These are quite large shafts and potentially very expensive. This is a significant assumption, Are these the largest shafts that would be required? What is the difference in cost and construction duration if the columns were a smaller diameter? What information is needed to the determine if smaller diameter shafts could be used and what are the cost savings? How can this be determined to refine potential construction costs prior to decision making by the Sound Transit Board?	The supporting documents in Appendix D were written early in the conceptual design process. The assumptions made were purposefully conservative to account for unknowns. If the Board selects the Midway Landfill Alternative as the project to be built, Sound Transit would conduct further studies to refine construction requirements.
30	Sec. 2,5 - Construction Phasing and Material Reuse, page 18, line 27 assumes a 5-acre open refuse area that will be limiting for space demands. How was the 5-acre open refuse area assumed and who makes that final determination? This might be able to be larger. Which agency makes this final determination and how can this be resolved prior to the decision making by the Sound Transit Board? If this can be larger, is there a potential reduction in cost and construction duration for Midway Landfill alternatives?	The 5-acre assumption is reasonable at the EIS stage in the planning process. The size would allow for continued control of landfill gas and water infiltration prevention. The actual size would need regulatory approval, and Ecology previously indicated they would allow only small areas to be open at a time. The 5-acre assumption was the basis for hauling transport modeling. Additional space would increase hauling and traffic impacts and could potentially overwhelm any facility receiving the material. The allowable open area would be coordinated with SPU and Ecology during final design if the Midway Landfill Alternative were selected as the project to be built.
31	Sec. 4,0 - Schedule, Page 33, Line 22, second schedule consideration states there may be an advantage to separating out. A description of the advantage should be included in the analysis.	As stated in Appendix D2, Interim Midway Landfill Preparation Memorandum, the schedules are preliminary and at a planning level. If the Board selects the Midway Landfill Alternative as the project to be built, Sound Transit would conduct further studies to refine construction requirements.
32	Appendix D3 Conceptual Landfill Refuse Plan Sec, 2.6.1 - Why is deep dynamic compaction proposed for the hybrid option but not the full excavation option when material will be removed and reused? See Figures 2 and 3.	The Full Excavation subsurface design option assumes complete backfill with competent soils. The Conceptual Landfill Site Reuse Plan was written as a high-level discussion to present possible construction approaches for the subsurface design options. If the Board selects the Midway Landfill Alternative as the project to be built, Sound Transit would conduct further studies to refine construction requirements.
33	Sec. 2.6.2.2 - Drilled Shaft and Slab Installation, Page 26, Line B states that the grid spacing for the drilled shafts changed from the 100-ft by 100-ft spacing due to land landfill optimization process. Line 2 identifies a 35-foot by 70-foot grid. What information led to this change and what is the impact to construction cost and duration?	As noted in the Conceptual Landfill Site Reuse Plan, the proposed spacing was modified after the design estimates for facility loads were advanced and more was learned about the landfill characteristics. At this very preliminary stage of engineering review of the Midway Landfill Alternative, it is not possible to make a definitive statement regarding the total schedule and budget, but it would have the potential to shorten the construction schedule and reduce cost. If the Board selects the Midway Landfill Alternative as the project to be built, Sound Transit would conduct further studies to refine construction requirements.

City of Kent (Communications ID 473482)		
Comment ID	**Comment Text**	**Response**
34	Sec, 2,6,2.3 - Environment Considerations During Construction, Page 30, Line 22 discusses reuse of screened soils from the landfill. How and when will this information be determined? This could have an impact on the cost and duration of construction'.	As noted in the Conceptual Landfill Site Reuse Plan, reuse of screened material would be subject to regulatory approval. Sound Transit would work with Ecology to determine the parameters of what would be allowed for reuse and what would need to be taken off-site for disposal. Actual screening could take place on-site. If the Board selects the Midway Landfill Alternative as the project to be built, Sound Transit would conduct further studies to refine construction requirements.
35	Sec. 2.6.3.1 – Truck Haul Routes – Are construction haul routes described in the documents for waste removal or all construction vehicles? Specifically, if the Midway Landfill site is selected, and concrete trucks are locally sourced, what is the route for the concrete trucks? City streets included in the haul routes for concrete trucks should receive an overlay at the conclusion of the project.	While the identified haul routes are meant to be representative of likely routes for waste-hauling vehicles, they could be representative for other construction vehicles as well. Should the Midway Landfill Alternative be selected as the project to be built after publication of the Final EIS, Sound Transit would identify haul routes as part of its traffic management plan and comply with measures as required by the Kent City Code.
36	Sec. 2.6.3.2 – Level of Service – If the Midway Landfill site is selected, and concrete trucks are locally sourced, how will the quantity of the concrete trucks impact traffic patterns? Does the data in Table 2-5 include concrete trucks?	Concrete trucks are included in the analysis presented in Table 2-5 of Appendix D3, Conceptual Landfill Site Reuse Plan, in the 2023 Draft EIS and this Final EIS. While the identified haul routes are meant to be representative of likely routes for waste-hauling vehicles, they could be representative for other construction vehicles as well. Should the Midway Landfill Alternative be selected as the project to be built after publication of the Final EIS, Sound Transit would identify haul routes as part of its traffic management plan and comply with measures as required by the Kent City Code.
37	Appendix D4 Midway Landfill Human Risk Assessment GENERAL QUESTION – For Contaminants of Interest, are there any potential mitigation measures that can be implemented during construction to mitigate any potential human health risks for all options at the Midway Landfill site?	Section 3.13, Hazardous Materials, in the 2023 Draft EIS and this Final EIS discusses avoidance, minimization, and mitigation measures that would apply to all subsurface construction design options for the Midway Landfill Alternative.
38	Appendix G1 – OMF-S DEIS – Transportation Technical Report Sec. 4.1.1.1 – Please update with Kent's current Transportation Master Plan.	Appendix G1, Transportation Technical Report, of the 2023 Draft EIS was revised to include the list of projects planned by the city of Kent. This update is reflected in the Final EIS.
39	Sec. 4.1.x – "Intersections" #2 (SR 99/S 244th St), #3 (SR 99/Midway Mobile Home Park), and #4 (S 246th St) are commercial driveways on the east side of SR 99 and do not need to be analyzed as intersections unless there is a direct impact on a public right-of-way intersection on the west side.	Based on the city's comment, Sound Transit removed the analysis of these intersections from the text of Section 3.1, Transportation, of the 2023 Draft EIS, but kept the analysis of them in Appendix G1, Transportation Technical Report. This update is reflected in this Final EIS.

City of Kent (Communications ID 473482)

Comment ID	Comment Text	Response
40	Sec 4.2.1.x – The location of the gates will need to be designed so expected queues do not extend into the public right of way assuming the likely usage and an additional safety factor.	Please see response to Comment ID 11.
41	Sec. 4.2.1.5 – Why would parking be lost on S 252nd St? The project would be required to construct standard frontage improvements which may include width for on-street parking.	The analysis conservatively estimated parking loss. The analysis assumed that roadway improvements on S 252nd Street could remove the gravel shoulder that some residents use for parking.
42	Sec. 4.2.2.1 – Converting the median to a southbound left-turn lane in the 24600 block will require WSDOT approval (RCW 46.61.020 (13)). Kent will require mitigation for the lost landscaping on the median.	Should the Midway Landfill Alternative be selected as the project to be built after publication of the Final EIS, Sound Transit would coordinate with the city of Kent and WSDOT on proposed roadway improvements during final design and comply with measures as required by Kent City Code.
43	Sec. 4.6.1 – With this much truck traffic, S 272nd St will need post-construction restoration.	Should the Midway Landfill Alternative be selected as the project to be built after publication of the Final EIS, Sound Transit would identify haul routes as part of its traffic management plan and comply with measures as required by Kent City Code, including post-construction restoration.

44	Potential Funding Resources
	The March 2021 *Center for Creative Land Recycling* newsletter included some articles that may be a resource for funding or resources that could be used should the Midway Landfill site be selected. The website for the *Center for Creative Land Recycling* can be found at https://www.cclr.org/. Also, the articles in the March 2021 Newsletter are listed below:
	1) Vision to Action: Engaging Communities for Better Redevelopment – https;//www.cclr.org/sites/default/files/V2A%20Fact%20Sheet%20%2B%20Case%20Studies%20%283%29.pdf

Re: Operations and Maintenance Facility – South Draft Environmental Impact Statement

Dear Sound Transit Board Members,

The City of Federal Way's Mayor and Councilmembers have reviewed the findings of the Draft Environmental Impact Statement (DEIS) of the potential sites for the Operations and Maintenance Facility South (OMF-South), conducted a Council Study Session with Sound Transit staff, have heard from our community, and have reviewed technical comments prepared by City staff. Our review has affirmed our belief that the Midway Landfill needs to be identified as the preferred alternative and ultimately be the site selected for this facility and the two Federal Way sites should be removed from further review.

We recognize that Sound Transit is building new transit infrastructure to support sustainable growth in our region. In doing so, Sound Transit should not make a decision that will have a lasting negative impact. Environmental review by way of NEPA and SEPA was implemented at the Federal and State levels to evaluate the impacts of government decisions in order to prevent them from causing unnecessary impacts to communities like those that the OMF-South will have in Federal Way. The 336th Street site will remove a church, a school, and a daycare that serve our community as well as residences and other businesses. The 344th Site will remove multiple churches, 20 residences, and a dozen businesses, including the Garage Town community that the DEIS presents as a single business but is in fact made up of over 60 unique owners and Ellenos Real Greek Yogurt, who recently invested millions of dollars in improvements to their regional and growing business. The Midway Landfill will displace significantly fewer businesses and employees, no residents, and no civic institutions.

The DEIS presents a clear preferred alternative when the impacts are considered and it is the Midway Landfill. In accordance with NEPA and SEPA, cost is not an Environmental Impact, however the prepared DEIS clearly shows that Sound Transit has elected to include costs within the decision matrix. In considering the overall impacts and a robust environmental review process, cost cannot be a factor in your decision, the impacts to the Federal Way sites are significant and will be far too detrimental to our community.

The DEIS inaccurately assumes that the City of Federal Way will approve vacating public roads, that City staff will modify our Development Standards to permit this development that would not be approved of other public or private developers, or that adequate mitigation to these items could be found. We strongly object to Sound Transit's finding of regulatory certainty on behalf of the Federal Way sites by unilaterally assuming City approval. Additionally, Sound Transit does not have adequate authority to commit the City of Federal Way to a future legislative act in vacation of opened and utilized public right-of-way.

The City and Sound Transit have a shared interest in the success of the light rail system and have enjoyed a successful partnership on the Federal Way Link Extension to date. We have seen and heard from Sound Transit a willingness to look to the future and make the decisions that are in the best interest for the future of this region. In this spirit, we ask that the Sound Transit Board remove the two Federal Way locations and select the Midway Landfill as the preferred alternative and site of the new OMF-South.

City staff will provide additional technical comments under separate cover.

Sincerely,

FEDERAL WAY MAYOR AND CITY COUNCIL

RE: Operations and Maintenance Facility – South DEIS City of Federal Way Technical Review Comments

Dear Mr. Hawkins and Mr. Rehmat,

Thank you for the opportunity to review and comment on the Draft Environmental Impact Statement (DEIS) for the Operations and Maintenance Facility South (OMF South). As you are aware, two of three sites that Sound Transit is considering are within the City of Federal Way. We have appreciated the collaborative nature of the relationship Sound Transit staff looks to have with the City.

The City has taken an official position on the OMF South in a previously provided letter signed by the Mayor and full City Council dated April 6, 2021. This second letter focuses on technical comments and input to help the EIS be finalized and published as the most accurate document possible.

City staff understands that this project is not intending to use Federal funds and therefore not subject to NEPA at this time and that the DEIS is issued as result of Sound Transit issuing a Determination of Significance under SEPA. In light of this and pursuant to WAC 197-11-550, many of our comments can be regarded as requests for clarifying or additional information.

However, items with greater significance are clearly identified as a request for alternative methodology or specific mitigation measures that will be necessary to allow the City to permit the project in the event that one of the locations within Federal Way is ultimately identified.

Construction Cost and Schedule

The DEIS prominently presents cost and construction schedule information in the executive summary, body of the DEIS, and in presentations to the public on the same level as displacements, ecological impacts, and other environmental impacts. Cost to the developer is not a factor of consideration in SEPA reviews or an applicable environmental element in the WAC that has to be considered. The DEIS does not clearly identify the basis for consideration of construction costs so City staff is unable to provide comment beyond that it is not an environmental impact and should not be considered in the EIS. By putting forth these three alternatives in the DEIS, Sound Transit has identified them as reasonable alternatives and should consider them against their environmental impacts alone.

If Sound Transit determines inclusion of costs is appropriate and should remain part of the EIS, then the discussion must be comprehensive for all three alternatives. High-level construction cost information was included for the Midway Landfill, but not for the other alternatives. Comparable evaluation of the relocation, property acquisition, and environmental mitigation would be necessary to understand how cost factors into the analysis being performed in the EIS. If such an analysis is not complete, then it should be noted why no further study is required and the actual costs should be removed and discussed at a summarized, conceptual level only. Other questions left unanswered with regards to cost include:

- Is Sound Transit limiting their ability to seek Federal assistance by building the mainline as part of a project not subject to NEPA?
- Why is the additional maintenance cost for the Midway site not addressed?
- What is the estimated cost of the mainline construction? Alteration to the BPA Power Lines?
- Why does the Midway Landfill Site consider additional costs for settlement even on the option to completely remove the waste from the site?
- The operating cost difference is not addressed in the DEIS, what is the reason for this difference?

As with the discussion on costs, schedule is not a typical environmental element. With no basis for inclusion provided, all discussion about construction schedule should be removed from the DEIS or considered comprehensively for all three site alternatives. As discussed under the City's comments on transportation impacts, both Federal Way alternatives require improved public rights-of-way to be vacated. The vacation process is expected to take 18-24 months and is a Council legislative action. This will add significantly to the timeline.

The following are additional comments relating to cost and schedule:

Page 2-24

- Work hour variance approvals will be required for the construction schedule presented to be allowed in Federal Way.

Page 2-29

- Section 2.6 just covers cost estimates. Where is a discussion on funding in this section?

Page 2-31

- Do these dates consider Sound Transit's realignment effort?
- Based on outlined schedule, 2024 is not a realistic start of construction with required ROW vacations.
- Table 2.7-1 does not present a feasible schedule including the Right of Way vacation process for FW. Sound Transit needs to review that and incorporate into schedule. Right-of-way vacation would need to start approximately early Summer of 2021 for the proposed schedule to be accomplished.
- The requirements, mitigation and processes for Right of Way vacation are not identified or included within the DEIS.

Transportation Impacts

Both site alternatives in Federal Way, 336th St. and 344th St., remove improved public rights-of-way and a north-south road connection. 341st Pl., 344th St., and 20th Ave. S., are all identified in the Federal Way Comprehensive Plan as minor collectors (refer to Map III-3). Additionally, they are each a bicycle route identified in Map III-16. The DEIS indicates the shared markings are an unfunded project when the project is currently out to bid. Additionally, the trip distribution model presented does not redistribute trips from the roads proposed for vacation.

We have appended to this letter an attachment that includes a number of comments and corrections to the Technical Appendix G1. These appended comments are meant to aid in improving the technical report to better inform the analysis of the EIS. The mitigation requested in the body of this letter takes precedence in our ability to permit the project.

The following comments relate to Section 3.2 of the DEIS:

Page 3.2-5

- Level of Service is not the basis for defining impacts associated with right-of-way vacations. Refer to FWRC Chapter 4.20.

Page 3.2-7

- While Section 3.2.1.4 may be correct that the Midway Landfill is primarily served by routes on Hwy 99, the Federal Way sites include Pierce Transit routes split between 336th St., Hwy 99, and 16th Ave S. King County only has a commuter route on Hwy 99.

Page 3.2-11

- Regarding Section 3.2.1.6, the City is in the process of updating on-street parking restrictions in the area and the rule will be in effect this summer.
- Regarding Section 3.2.1.7, the number of collisions is only one part of the safety measures the City uses and is meaningless by itself. For intersections, the City uses collision rate (collisions per million entering vehicles); societal cost; and severity rate (societal cost per million entering vehicles). The DEIS should use these measurements as they are more useful to determining whether mitigation is needed and will ultimately be required as part of Concurrency permitting of the sites.

Page 3.2-14

- Verify that Pierce Transit will continue their service long-term. They have stated they intend to truncate their lines at the South Federal Way Station when TDLE opens.
- Installation of shared lane markings for bicycles is currently out to bid.

Page 3.2-15

- Why not use a travel demand model for more realistic trip assignment, especially when roadway closures would redistribute trips?

Page 3.2-23, Table 3.2-8

- Standard v/c is 1.0 at unsignalized intersections in Federal Way.
- V/c needs to be reported for all intersections in Federal Way.

Page 3.2-39

- The City can provide actual traffic counts upon request and Table 3.2-17 as well as other sections of the report can be updated to provide more accurate information. AADT is not typically presented as a range.

Page 3.2-41

- All signage is required to be reflective regardless, so providing it is not a mitigation measure.

Page 3.2-42

- Section 3.2.3 is incorrect for the Federal Way sites as the facility has long-term planning and operational impacts by not providing a road network consistent with City Development Standards and removing existing roads incorporated into the Comprehensive Plan.

Alternative Methodology - Transportation

The trip distribution modeling needs to address the redistribution of existing trips based on the proposed conditions. Further analysis and appropriate mitigation is required as part of any request for a right of way vacation under Federal Way code.

Mitigation - Transportation

No mitigation for the loss of the roads or alternate travel routes is identified nor do the conceptual designs meet Federal Way Development Standards for vehicular block perimeter. The City of Federal Way requires the project mitigate all public roadways being vacated by incorporating roadways of identical functionality for vehicles, pedestrians, and bicycles in a manner that complies with the City's block perimeter requirements and Comprehensive Plan.

Public Safety

The DEIS correctly states that the City of Federal Way has expressed concerns over the potential effects on response times from either the 336th St. or 344th St. alternatives. 20th Ave. functions as a bypass road for Pacific Highway and 16th Ave. that provides an alternative north-south route for officers who may be responding from anywhere in the City. Section 3.14 states that "it is not possible to accurately determine how the road closure would affect their response time." While then concluding that "the closure [of 20th Avenue] would likely have very little impact on their response time to the area".

We disagree that this impact to response times is insignificant. Given that this issue was identified prior to publication of the DEIS and no mitigation is provided, there must be an analysis to justify the findings in the EIS.

Mitigation – Public Safety

Incorporate a replacement north-south connection parallel to 16th Ave and Pacific Highway for emergency vehicle response. This mitigation overlaps with the requested mitigation for the impacts to the City road network.

Economic and Fiscal Impacts

The following comments relate to Section 3.5:

- Sound Transit should provide actual counts for employee displacements rather than estimates.
- Property taxes as a snapshot in time should be easily calculable as they are published every tax year by the King County Assessor's Office.
- The DEIS does not consider the opportunity cost difference between the three sites. As a landfill and Superfund site, the Midway site will likely have a low opportunity cost. City staff contracted with the FCS Group to assess the opportunity cost of the Federal Way's sites. The findings include that the 344th St. and 336th St. sites have 31.4 and 21 acres of vacant or redevelopable land respectively based on King County buildable lands guidance. As the OMF-South will represent a permanent change of land use to public/institutional, the diminished capacity for population and employment growth for the region that change in use represents needs to be considered.

Page 3.5-8, Table 3.5-5

- The City had the FCS Group review potential employment. Their review found general concurrence with the baseline for the estimated employees directly displaced, but found the impact of those jobs lost would cause a significant number of additional jobs to be lost in the area. In total, the OMF-South will result in $30 - $50 million in lost economic output depending on what site is chosen.
- We understand the information presented to be based on the conceptual 10% OMF-South plans. However, the DEIS needs to acknowledge that any change to the design that expands the footprint will not be inconsequential. Environmental mitigation, additional transportation improvements, and stormwater management are all risks to the footprint expanding. The immediate area surrounding either Federal Way site alternative supports over 300 additional jobs.

Page 3.5-9

- Reference to fiscal impacts as small is a matter of opinion. The DEIS language should be neutral.

- Clarify whether the proportion of assessed valuation is based on assessed valuation or taxable valuation. As all land and buildings typically have an assessed valuation even if they are tax exempt, such as government buildings or developments receiving special tax exemptions. Taxable valuation is more relevant to assessing economic and fiscal impacts.

Alternative Methodology – Economics

- Provide an accurate count for the purposes of employment displacement.
- Consider indirect and induced job loss, as well as economic output loss.
- Address the level of risk and the potential consequences to the OMF-South footprint expanding as design progresses. Further plan development beyond 10% may be required to provide this information and an accurate comparison with the three sites.
- Evaluate and assess the impact to growth capacity and the economic opportunity costs for the three alternative sites. The City has evaluated the 344th St. and 336th St. sites and found the potential impacts to tax revenue to be even greater than estimated impacts based on current development. Industrial vacancy rate in the City is approximately 0.5% and the lost employment opportunities represent a 50% to 100% increase in direct employment effects.

Land Use Impacts

The following comments relate to Section 3.4:

Page 3.4-20

An essential public facility (EPF) is allowed in all zones consistent with State Law and pursuant to FWRC 19.105.020. The design has not progressed to a point for specific mitigation to be discussed, but at a minimum land use compatibility measures consistent with Federal Way Revised Code is required. The project is also expected to comply with community design guidelines under FWRC 19.115.

The following comments are from City staff review of Appendix F, Technical Report on Land Use:

Page F2-10

- Table F2-4 is incomplete without acknowledging that the OMF-South is considered an EPF and will be reviewed under FWRC 19.105.020.

Page F2-13

- The information presented in Appendix C is not sufficient to justify the finding that the response to LUP14 is accurate or feasible.
- With regards to the comment on LUP23, how is a finding that alternative facilities could be developed consistent with the lack of provision of alternative facilities in the conceptual designs presented in Appendix C? One of the alternatives stretches from I-5 to 16th Ave. which eliminates the possibility for an alternative facility.

Page F2-14

- Comprehensive Plan policies need to be considered in totality. The proposal does not seem consistent with LUP35 or LUP38.
- With regards to the finding on LUP47, the Neighborhood Business (BN) zone is not proximal to the light rail system.
- With regards to the finding of LUP59, this sentence doesn't make sense as this policy states that the City development code will have a process for reviewing EPFs as per State law. The policy is not for de facto EPF approval nor is approval of an EPF implementation of this policy.

Additional Information – Land Use

Describe the proposal in enough detail to affirm that adequate room exists for appropriate compatibility between land uses. Deference to complying with code is identified, but a specific landscape buffer and planting schematic is not. The EIS needs to verify that adequate room exists on the site for this buffering after considering construction of lead tracks, security needs, and guideway clear zone requirements. The conceptual plans are not detailed enough for us to concur that mitigation is feasible.

Mitigation – Land Use

EPFs are required to provide mitigation based on the level of impact which will be reviewed as the project develops and information is refined. However, it is noted that FWRC 19.125 requires a 25-foot Type 1 landscaping buffer between industrial uses and residential zoning districts. That provides a baseline as to the level of screening that will be expected for at least a portion of the 336th St. and 344th St. alternatives. The impact of the guideway clear zone on the ability to meet the planting performance standards must be considered.

Environmental and Water Resources

The DEIS notes that Sound Transit will develop plans to mitigate "the effects of the project on wetlands, streams, and regulatory buffers on a watershed basis." The work is noted as being planned to be done in accordance with Federal, State, and local requirements as well as through consultation with tribal biologists. Similarly, water resources are noted as providing of mitigation through compliance with applicable stormwater permitting requirements. Such a broad statement for purposes of mitigation is hard to refute and we encourage Sound Transit to thoroughly evaluate the feasibility of the path forward for the Federal Way sites.

The following comments apply to Section 3.10:

- Has the potential need for large, woody debris as part of the stream restoration been evaluated? This could add to any potential flooding complications.
- Loss of fish habitat and associated identifiable mitigation is not included.

Page 3.10-6

- This section notes that the West Fork Hylebos Creek Tributary is subject to flooding issues while also noting the plan is to regrade the area constricting the wetland and possibly the stream bed. There doesn't appear to have been adequate hydraulics analysis to assess the feasibility of this work as presented in Appendix C.
- It is not clear how City Code will be met as part of regrading and realigning a stream channel.

Page 3.10-11

- The S 344th St. site indicates there is a 60-foot culvert in the current designs to accommodate an emergency access road. Under FWRC 19.145 it will be very challenging to meet the requirements to build a new culvert for a stream. Alternative site designs must be provided to show there is no other option and convenience is not a justification. The design needs to be updated to remove the culvert.

The following comments applies to Appendix G3 and is from pages G3-8 and G3-9:

- The Executive Proposed Basin Plan Hylebos Creek and Lower Puget Sound (King County 1991) should be a data source considered.

The following comment applies to Section 3.11 and is from page 3.11-14:

- Shouldn't the relocation of the existing WSDOT stormwater facility be part of the environmental analysis? No location is identified and it is a result of the proposed project.

Noise and Visual Impacts

The assessment of visual impacts by the Federal Way site alternatives, which both impact 336th at I-5, did not adequately address the presence of the historic Weyerhauser Campus immediately east. 336th St. and 344th St. site visual impacts need to be considered from former Weyerhaeuser property along 336th; this would likely change its level of visual impact from medium to medium-high or high;

The following comments pertain to Appendix G2:

- What is the source for the projected project noise level? How will this be verified against project completion?

Page G2-11

- What about bells from the light rail vehicles or other signals at crossings or upon exiting onto the tracks? This is not directly addressed.

Cumulative Impacts

The Commercial Enterprise (CE) zone is the only light industrial zone in the City of Federal Way and land will be converted for both the OMF-South (should a Federal Way location be selected) and the Tacoma Dome Link Extension. The cumulative impacts section discusses the impacts of light rail in the context of typical mixed-use, transit-oriented development which is not consistent with the current City industrial zoning. TDLE will be building stations in industrially zoned and/or developed lands in Fife and Tacoma (east station). Industrial land is at a premium in the region and if it is challenging for businesses displaced by transit facilities to relocate, it may push them further out to find suitable locations (as previously noted, the vacancy rate is as low as 0.5%). This related action could lead to sprawl or greenfield development and the DEIS should contemplate cumulative impacts of this land conversion comprehensively. The DEIS needs to consider the cumulative impacts of all known Sound Transit projects on industrial land supply based on current zoning.

Section 2.4.1 notes the OMF South and OMF North will have greater capacities than OMF East and OMF Central. What is the impact of other link extensions? This implies OMF North and South will produce greater externalities. Total capacity of the 4 OMFs is 496 LRVs. As OMF South is being built before OMF North, any reduction in footprint as a result of planned capacity exceeding project capacity will fall on OMF South. Section 4.5 should include a table of the link extensions coming online, such as Lynnwood and East, along with OMF capacities to better highlight the need and impacts of regional light rail extensions within Sound Transit 3.

Please reach out to either of us or Ryan Medlen if you have any questions regarding the comments in this letter.

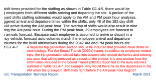
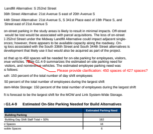
Please elaborate on trip distribution methodology. Why weren't other sources used (such as local transportation models or census data)



Page Index: 76

A separate trip generation section should be included that provides more detail on methodology. Per the Sound Transit (2020a) report, in addition to employee-related trips, the trip generation should take into account site-related deliveries and existing site uses that will be removed as a result of the project. It is also unclear how the information included in the Sound Transit (2020b) report led to the auto volumes outlined in Table G1.4-7. For example, why would there be so few departures in the AM when the graveyard shift ends right before the AM peak hour begins?

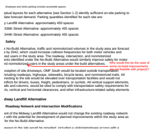
78 (1)



Page Index: 78

Please provide clarification: 450 spaces of 427 spaces?

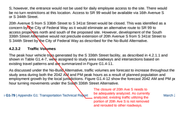
79 (1)



Page Index: 79

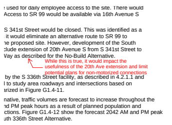
Why would this be the case of some no-build improvements are not feasible with projects?

88 (3)



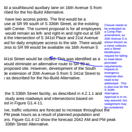
Page Index: 88

The closure of 20th Ave S needs to be adequately analyzed. As currently analyzed, existing traffic utilizing the portion of 20th Ave S is not removed and rerouted to other roadways.



Page Index: 88

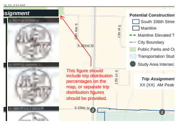
While this is true, it would impact the usefulness of the 20th Ave extension and limit potential plans for non-motorized connections



Page Index: 88

Closure needs to be evaluated as a Comp Plan amendment, as 20th Avenue S is shown therein as a minor collector, and a Street Modification request for failing to meet block perimeter requirements. Impacts to emergency response also need to be addressed. This is also true for the S 344th Alternative. Approval is in no way assured, but realignment may be considered.

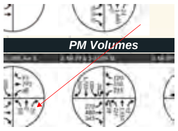
89 (1)



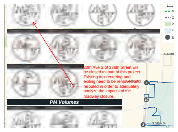
Page Index: 89

This figure should include trip distribution percentages on the map, or separate trip distribution figures should be provided.

90 (2)



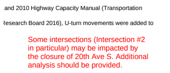
Page Index: 90



Page Index: 90

20th Ave S of 336th Street will be closed as part of this project. Existing trips entering and exiting need to be removed and rerouted in order to adequately analyze the impacts of the roadway closure.

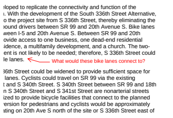
93 (1)



Page Index: 93

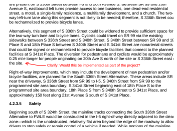
Some intersections (Intersection #2 in particular) may be impacted by the closure of 20th Ave S. Additional analysis should be provided.

95 (2)



Page Index: 95

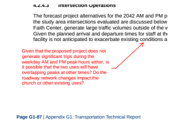
What would these bike lanes connect to?



Page Index: 95

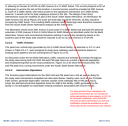
Clarify: Would this be implemented as part of the project?

96 (2)



Page Index: 96

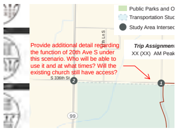
Given that the proposed project does not generate significant trips during the weekday AM and PM peak hours either, is it possible that the two uses will have overlapping peaks at other times? Do the roadway network changes impact the church or other existing uses?



Page Index: 96

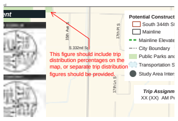
For trips removed from intersection #6: volumes should either be: (1) rerouted to other intersections in the network, or (2) if to be removed completely, trips should be removed at other intersections as well and justification should be provided as to why those trips will be removed from the network.

97 (2)



Page Index: 97

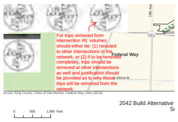
Provide additional detail regarding the function of 20th Ave S under this scenario. Who will be able to use it and at what times? Will the existing church still have access?



Page Index: 97

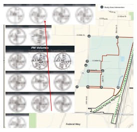
This figure should include trip distribution percentages on the map, or separate trip distribution figures should be provided.

98 (4)

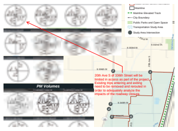


Page Index: 98

For trips removed from intersection #6: volumes should either be: (1) rerouted to other intersections in the network, or (2) if to be removed completely, trips should be removed at other intersections as well and justification should be provided as to why those trips will be removed from the network.

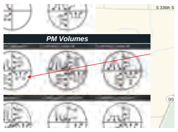


Page Index: 98



Page Index: 98

20th Ave S of 336th Street will be limited in access as part of the project. Existing trips entering and exiting need to be removed and rerouted in order to adequately analyze the impacts of the roadway closure.



Page Index: 98

99 (1)

RE Sound Transit OMF Site Opportunity Cost Impact Assessment DRAFT

INTRODUCTION

As Sound Transit expands its light rail network throughout the region, it has identified the need for a new regional Operations and Maintenance Facility (OMF) to store and maintain its growing fleet of vehicles. The agency has determined that an OMF should be located to the south of Sea-Tac International Airport. Sound Transit has pared down an initial list of candidate sites to three, including one on a landfill site in Kent and two potential sites in Federal Way.

The City of Federal Way contracted with **FCS** GROUP to analyze the potential economic impacts of the two Federal Way sites. A previous Memorandum by FCS dated April 13 describes the potential short-term economic impact of the OMF based on the most current assumptions that have been made available by Sound Transit as of April 1, 2021.

Because much of the property being considered by Sound Transit is classified as vacant or underutilized land, this Memorandum evaluates the opportunity cost to local and state governments if this land is utilized by the OMF. When vacant and underutilized land is not developed by private (or not-for-profit) entities at its highest and best use it will not produce governmental tax revenues, jobs or housing. This in-turn represents a potential opportunity cost associated with foregone future tax revenues, jobs and housing within local and state government agencies.

SITE DESCRIPTIONS

For the purposes of this analysis, FCS evaluated the two Federal Way sites. The two sites are adjacent to one another located between Pacific Highway and Interstate 5 in the Kitts Corner area of the City (see the site map in **Exhibits 1 & 2**). There is a 27.37-acre area which is a part of both sites consisting of warehouses, residential and industrial properties and housing.

The two sites are as follows:

- **344th Street Site**: is a 59.64-acre site south of the CFC site. Existing uses are primarily industrial and commercial, with some single family residential, spread across 52 separate parcels with a southern boundary along South 344th Street. The site includes the 27.37-acre area that is shared (included) with the CFC site mentioned below. The vacant and redevelopable land within this site (31.43 net acres) is identified by zone classification in **Exhibit 3**.
- **Christian Faith Center (CFC) Site:** is a 59.98-acre northernmost site which is primarily owned by the Christian Faith Center, including a large church, school and community facility. The CFC owns 80% of the site, the remainder includes the 27.37-acre shared area mentioned above. This

site will be referred to as the CFC site in this study. The vacant and redevelopable land within this site (21.06 net acres) is identified by zone classification in **Exhibit 3**.

The tax lots shown in **Exhibits 1 and 2** were evaluated using current King County Assessor data and local planning data to determine their current zoning, gross land area and current value of land and improvements. Land that is potentially constrained by "critical areas" such as wetlands and drainage areas has also been considered in the calculation of net vacant land area.

Land within the OMF sites have been classified by current land use zoning designation and grouped into three categories:

- **Developed:** defined to include tax lots with an improvement value greater than land value based on King County Assessor data;
- **Vacant:** includes tax lots that are classified by the King County Assessor as vacant;
- **Redevelopable:** includes underutilized tax lots where the land value is equal or greater than the improvement value per the King County Assessor records.

This analysis focuses exclusively on the vacant and redevelopable tax lots. The calculation of gross and net land area and building area (SF) for the OMF Sites is summarized in **Exhibit 3**.

As indicated below, this buildable land analysis has identified a total of 31.43 acres of vacant and redevelopable land within the 344th Site, including 24.23 vacant acres and 7.20 redevelopable areas. The majority of this vacant and redevelopable land (15.75 acres) is planned for higher density multifamily housing with an underlying zone classification of RM3600. The 344th Site also incudes 15.68 acres of vacant and redevelopable Commercial Enterprise (CE) and Business Commercial (BC) land area.

The CFC Site includes 21.06 acres of vacant and redevelopable land area, including 18.49 acres of vacant land and 2.57 acres of redevelopable land. All of the vacant and redevelopable multifamily land is shared between the two sites. Please refer to **Appendix A** for a more detailed summary of the vacant and redevelopable land base and the underlying land use zoning allowances.

Exhibit 3: Summary of Vacant and Redevelopable Land Area

Vacant & Redev. Land Area (acres)*	344th Parcels	CFC Parcels	Shared Parcels
RM 3600 Zones			
Vacant	14.32	14.32	14.32
Redevelopable	1.43	1.43	1.43
CE/BC Zones			
Vacant	9.91	4.17	3.08
Redevelopable	5.77	1.14	1.14
Total			
Vacant	24.23	18.49	17.40
Redevelopable	7.20	2.57	2.57
Total	**31.43**	**21.06**	**19.97**

* Excludes land classified as critical lands and developed lands.
Redevelopment land is defined as having land value equal or greater than existing improvement value.

KEY ASSUMPTIONS

To assess the potential impact of utilizing vacant land for the OMF in lieu of private development, FCS evaluated opportunity costs in terms of housing, population, employment, and foregone tax revenues. Key metrics include:

- **Property Tax Revenue:** Taxable property values for each OMF siting scenario were based on current records provided by the King County Assessor's office. It is assumed that the OMF would be tax-exempt public property. The opportunity cost analysis assumes that vacant and underutilized land is developed as taxable private property by year 10 (2031). Current property tax millage rates were applied to the taxable value in each area to calculate the potential loss of property tax revenue. It should be noted that for analysis purposes, current property ownership status (private vs. non-profit) is not considered to be a constraint regarding a site's future development potential or taxable status. Hence, this analysis assumes that a non-profit, such as the CFC, will eventually opt to sell some of its land to a private developer, who then develops the property for its zoned use.

- **Local Retail Sales Tax:** Retail sales reports from ESRI Business Analyst Online and Dunn & Bradstreet were used to identify taxable sales within the potential OMF sites. Annualized retail sales figures were multiplied by the City's current local sales tax rate (1%) to determine sales tax revenue once vacant and redevelopable land is developed by year 10 (2031).
- **State Shared Revenues:** This group of revenues is distributed by the State to cities based on population. In this analysis, the revenue estimates are the per-capita distribution multiplied by the number of people residing in each site. The Washington Municipal Research and Service Center (MRSC) provides per-capita distribution estimates for each type of State shared revenue. The opportunity cost analysis assumes that vacant and redevelopable multifamily zoned tax lots are fully developed by year 10 (2031) based on their underlying zoning and development standards. Following are the types of State shared revenues and the MRSC estimated distribution per capita:
  - Liquor Excise Tax: $5.66 per resident.
  - Liquor Control Board Profits: $7.90 per resident.
  - Motor Vehicle Fuel Tax (base): $20.07 per resident.
  - Motor Vehicle Fuel Tax (increase): $1.17 per resident.
  - Multi-Modal Transportation Tax: $1.34 per resident.
  - Criminal Justice Distribution: $1.17 per resident.
- **Housing and Population:** The opportunity cost analysis assumes that the vacant and underutilized multifamily zoned tax lots are fully developed by year 10 (2031) at allowed densities under current RM3600 zoning. For analysis purposes, it is assumed that this land is developed by a for-profit developer and allowances have been made for potential housing displacement. The analysis conservatively assumes that the vacant land which is partially impacted by critical lands does not transfer development density to unconstrained portions of their sites. Please refer to **Appendix B** for a summary of key development assumptions. Since there are few comparable multifamily developments in the OMF analysis area, FCS conducted a residual land value analysis to determine the scale and value of a large apartment development on a portion of the vacant land zoned for housing (see **Appendix C**).
- **Employment:** The opportunity cost analysis assumes that the vacant and underutilized CE/BC zoned tax lots are fully developed by year 10 (2031). It is assumed that this land is developed by a for-profit developer, and allowances have been made for potential business/job displacement as older buildings are replaced with new ones. Please refer to **Appendix B** for a summary of key assumptions.

ECONOMIC OVERVIEW

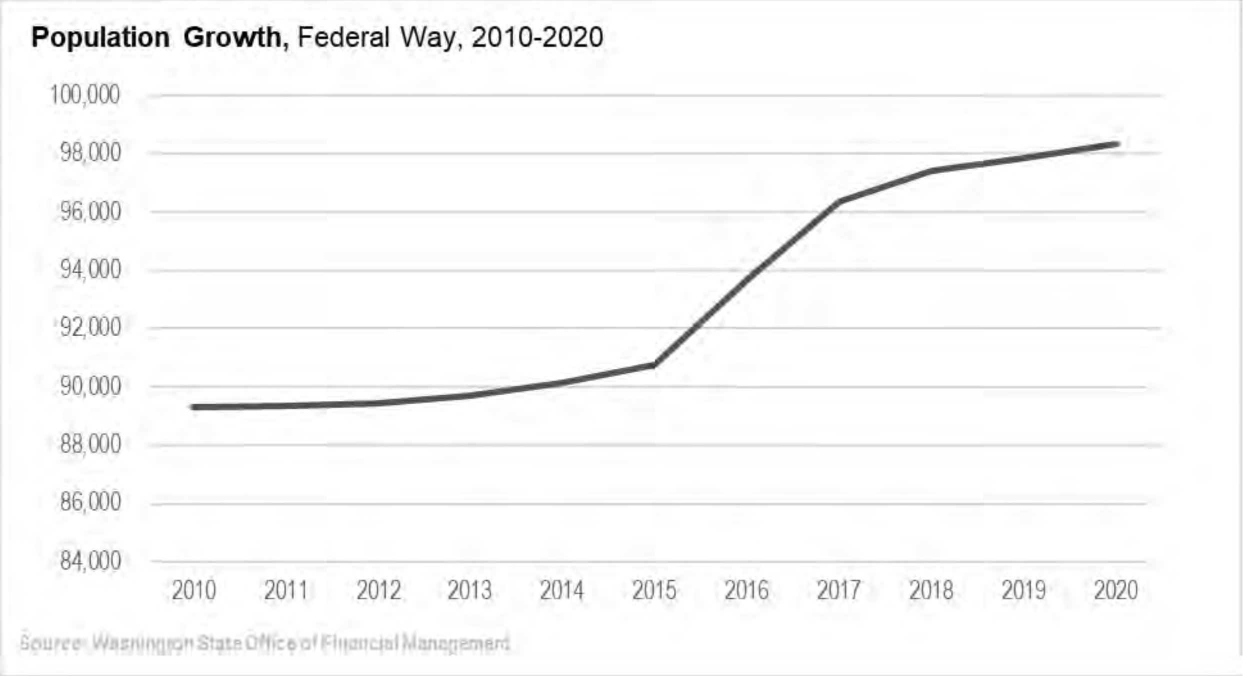
The Puget Sound Region is currently one of the fastest growing metropolitan areas in the United States. Significant population and employment growth has been occurring for decades and shows no sign of moderation.

Population

The City of Federal Way recorded a record-high population of 98,340 in 2020 (April 1 estimate by the Washington State Office of Financial Management (OFM) (**Exhibit 4**).

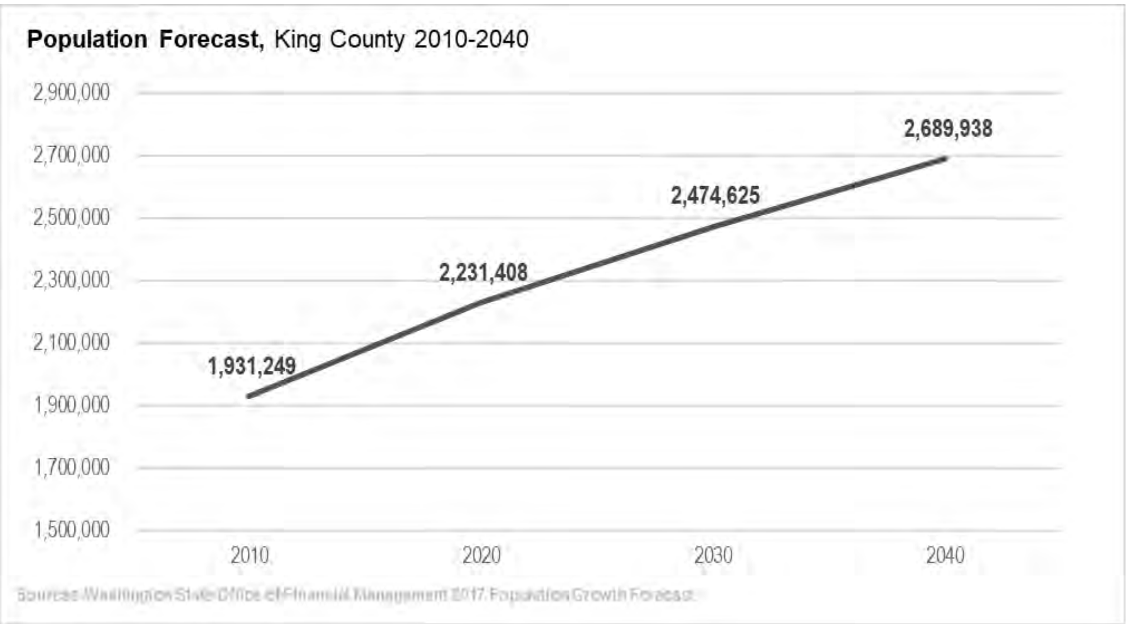
Long-range population forecasts prepared by OFM are not available on the city level but do anticipate King County will continue its rapid growth with nearly half a million new residents added to the County between now and 2040 (see **Exhibit 5**). If Federal Way's 4.4% share of King County's population growth holds constant, the City would be on tap for accommodating over 20,000 additional people by year 2040.

Exhibit 4: Population Trends (2010-2020)



Source: Washington State Office of Financial Management

Exhibit 5: King County Population Projection (2010-2040)

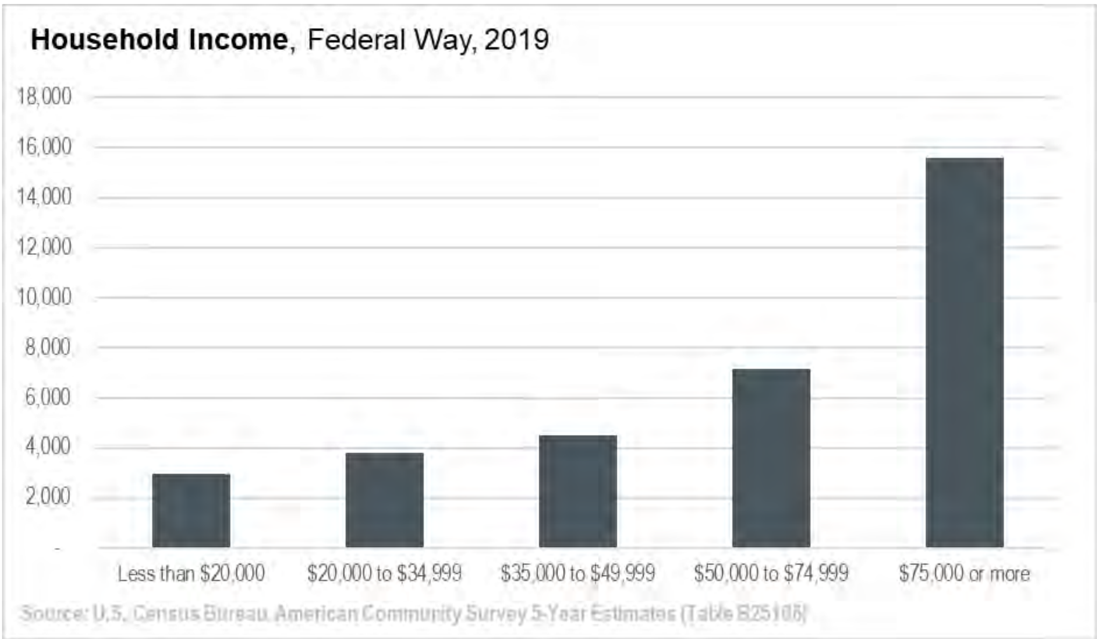


Source: Washington State Office of Financial Management 2017 Population Growth Forecast

Socio-economic Characteristics

As with many cities in the Puget Sound Region, income levels are relatively high in Federal Way compared with the rest of the state of Washington. As indicated in **Exhibit 6**, nearly half of the City's residents had household incomes above $75,000.

Exhibit 6: Households by Income Level, 2015-2019

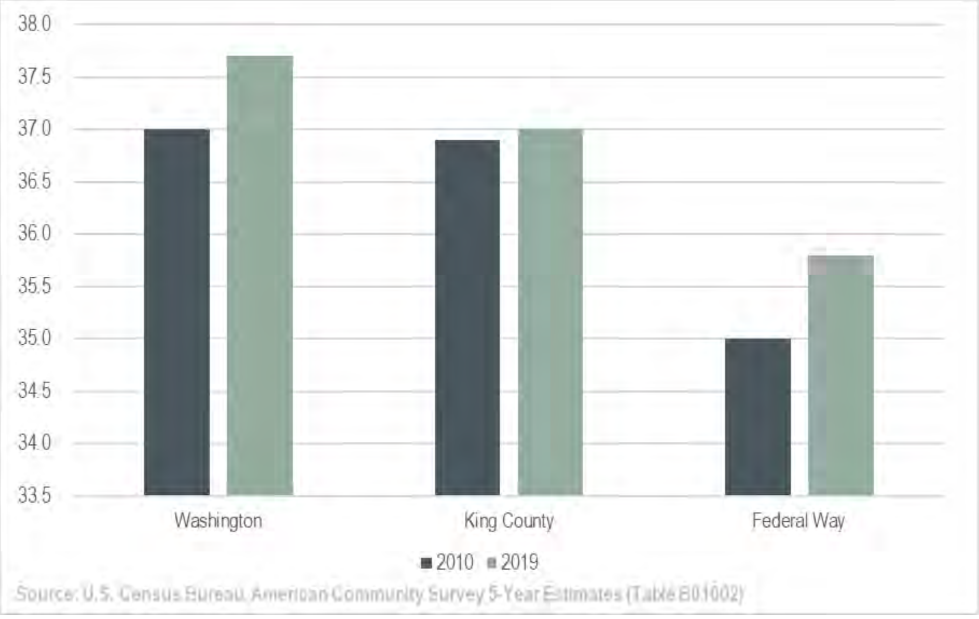


Source: U.S. Census Bureau American Community Survey 5-Year Estimates (Table B25108)

In comparison with the state and county averages, Federal Way has a higher share of younger residents. The median age in Federal Way (35.8) is below the King county and statewide average

(**Exhibit 7**). Younger families tend to require new housing arrangements as they age, start families and have children.

Exhibit 7: Median Age, Washington, King County, Federal Way, 2010, 2019



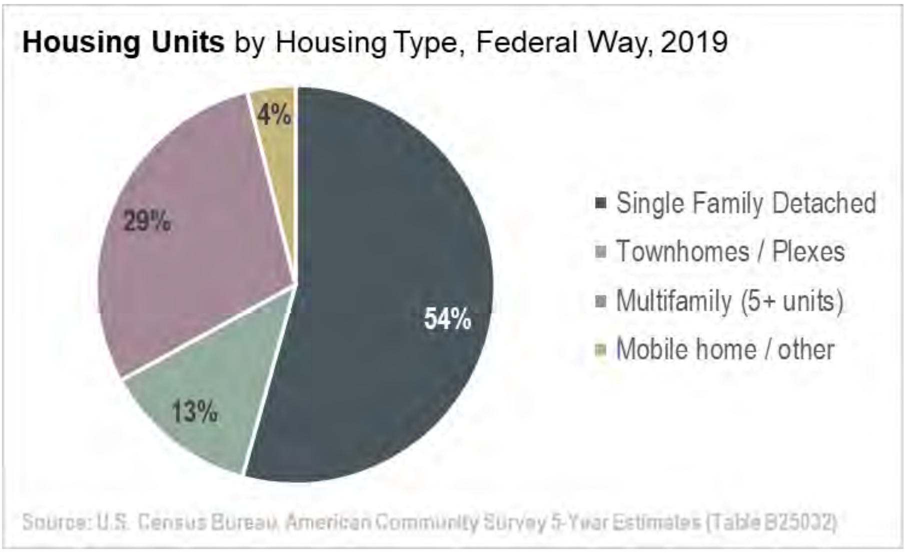
Source: U.S. Census Bureau, American Community Survey 5-Year Estimates (Table B01002)

EXISTING HOUSING INVENTORY AND TENANCY

Local housing inventory and tenancy patterns shed light on housing conditions and demand preferences. In 2019, there were 34,755 housing units in the City of Federal Way.

Like most communities, single-family detached housing is the most prevalent housing type with 54% of the housing stock. The remaining housing inventory in Federal Way includes multi-family (29%), townhomes and duplexes (13%), and mobile homes (4%), as shown in **Exhibit 8**.

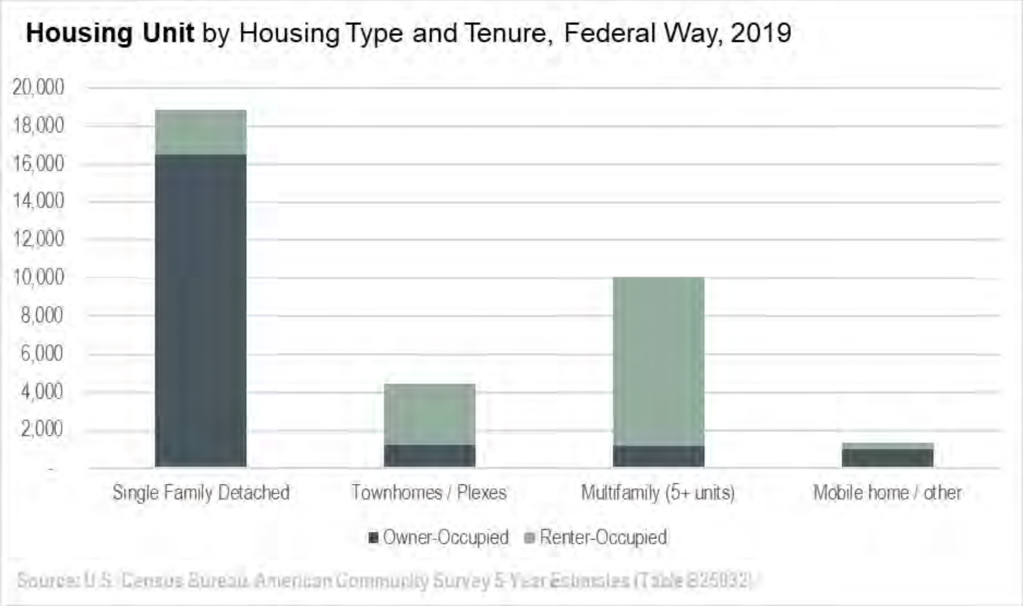
Exhibit 8: Existing Housing Mix and Tenancy, 2015-2019, City of Federal Way



Source: U.S. Census Bureau, American Community Survey 5-Year Estimates (Table B25032)

Owner-occupied housing accounts for 57% of the housing inventory while renter-occupied units account for 43% of the inventory. As would be expected, most homeowners reside in single-family detached units or manufactured homes. Most renters also reside in by single family attached and multifamily units, as indicated in **Exhibit 9**.

Exhibit 9: Existing Housing Tenancy, 2015-2019, City of Federal Way

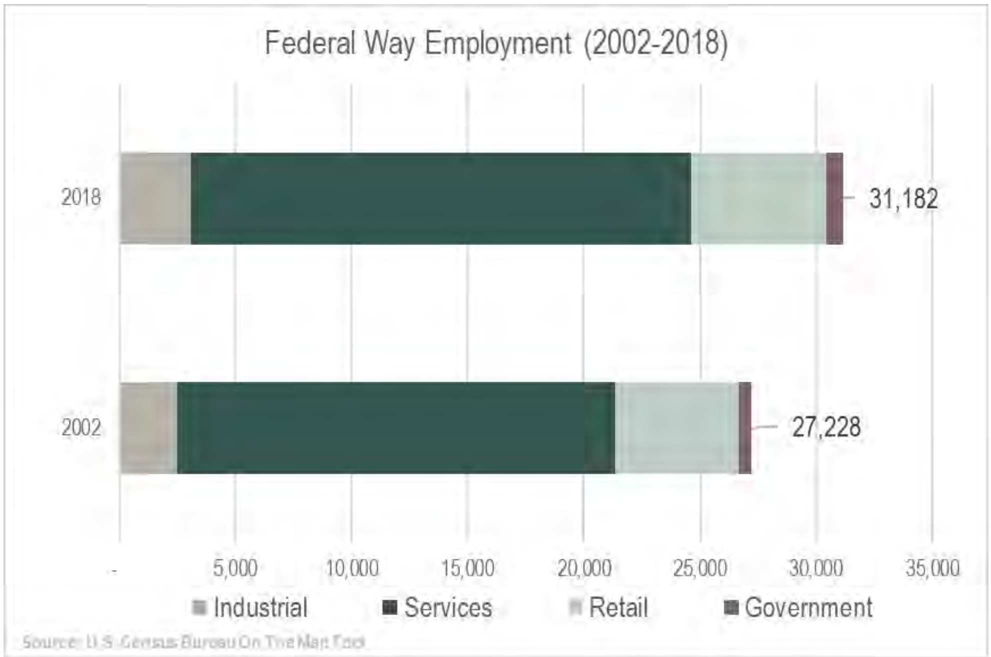


Source: U.S. Census Bureau American Community Survey 5-Year Estimates (Table B25032)

EMPLOYMENT

Between 2002 and 2018, employment levels in Federal Way climbed by nearly 4,000 jobs, with most growth occuring in the industrial and services sectors (**Exhibit 10**).

Exhibit 10: Federal Way Employment (2002-2018)



Source: U.S. Census Bureau On The Map Tool

REAL ESTATE MARKET OVERVIEW

The greater Puget Sound real estate market is beginning to bounce back from the Covid-19 pandemic. Key market indicators are described below based on published residential and commercial real estate broker reports for the 1st Quarter 2021.

Industrial Real Estate

- Industry professionals expect 2021 to be a record breaking year for the industrial real estate market in the Puget Sound.
- Vacancy is stable region-wide at 5% and year-over-year lease rates are beginning to increase.
- Absorption has begun to outpace project completions, indicating a tightening market overall.
- The Federal Way market is particularly tight with an overall industrial vacancy rate of 0.5%.
- Average total asking rent in Federal Way is 17% higher than the regional average.

Office Real Estate

- Industry professionals caution that until the vast majoritiy of the workforce is immunized agaisnt Covid-19, it is unlikely that the office market will return to pre-pandemic conditions for years. Vacancy rates continue to increase in the region, rising to 7.7% in Q4 2020.
- Within the South King County submarket, office vacancy is at the highest levels observed in the region (14.1%).
- New development activity is still high and 72% of the new office developments in the region are pre-commited.
- Alaska Airlines HQ expansion project is presently under construction and will be a highlight of the regional office market.

Retail Real Estate

- Industry professionals highlight the “twin threats” to retail from both Covid-19 and increases in e-commerce.
- Vacancy rates began to decrease in Q4 of 2020, settling at a rate of 3.18%.
- While growth in retail lease rates was modest, there was a slight year-over-year increase.
- Industry experts expect a slight “snap back” with vacancy increasing about 0.8% in the first half of 2021 before stablizing later in the year.

Multifamily Housing

- Multifamily real estate is taking longer to bounce back from the dip observed in 2020 with overall vacancy rates in the region up from 5.7% in Q1 of 2020 to 7.6% in Q1 of 2021.
- Institutional investments in multifamily developments is up significantly year-over-year.
- Year-over-year multifamily construction activity in the Region is up to 3,411 units in Q1 2021 compared with 3,006 units in Q1 2020.

- Average monthly rents in the Region during Q1 2021 range from $1,297 (studio), $1,503 (1 bedroom), $1.797 (2 bedroom) and $2,126 (3 bedroom).
- While the short-term market impacts of the Covid-19 pandemic is still being felt, the long-term economic growth trend for the Puget Sound Region, King County and Federal Way is very positive.

OPPORTUNITY COST METHODOLOGY

This opportunity cost analysis generally follows the methodology applied in the previous OMF economic impact analysis by FCS. The steps taken include:

Step 1. Identify and quantify vacant and underutilized tax lots and land area by land use zone (based on Assessor data).

Step 2. Estimate and deduct critical lands from gross land area (based on King County Critical Lands maps layer).

Step 3. Identify existing buildings, jobs and housing units on vacant and underutilized tax lots (based on Assessor data).

Step 4. Review applicable current zoning and development standards regarding allowable building density, height, parking requirements, setbacks, etc.

Step 5. Analyze County Assessor data to compare appraised value of land and building improvements of developed properties to vacant and underutilized properties. Apply findings to the vacant and redevelopable land inventory to estimate potential increases in assessed value and taxable construction materials for new development in the CE/BE zones.

Step 6. Analyze existing employment and sales data for existing enterprises within the CE/BC zones and apply vacancy and job density assumptions to the vacant and redevelopable land area to estimate potential net changes in employment and taxable sales.

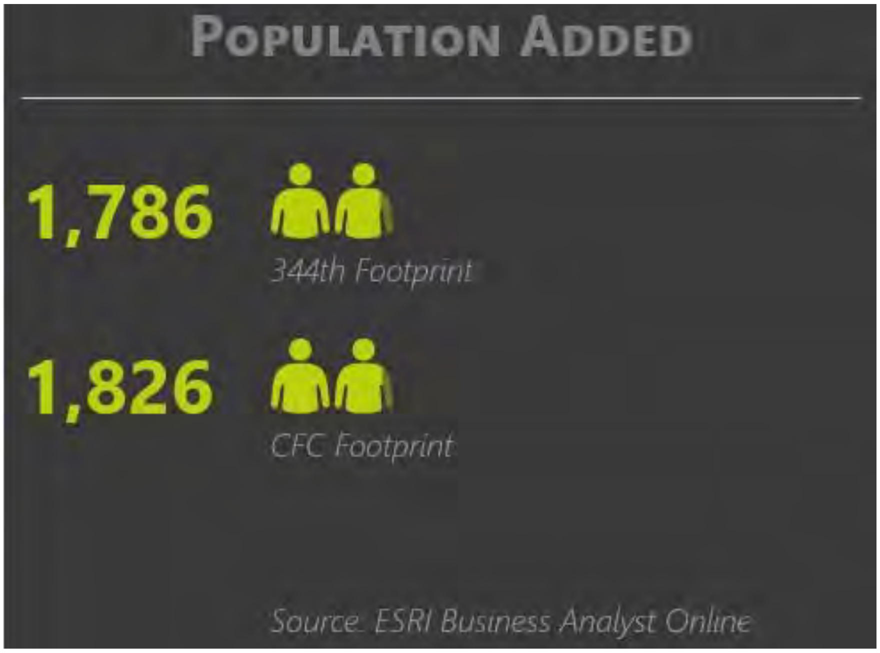
Step 7. Conduct Residual Land Value analysis for the multifamily sites to determine the allowable use of those sites if fully developed. This analysis (provided in **Appendix C**) is considered common practice when analyzing housing and mixed-use development potential. The findings are used to estimate: land and improvement values; housing units; population; and related factors.

Step 8. Apply current tax rates to values derived from steps 1-7 to determine fiscal impacts on local and state governments if vacant and redevelopment sites are not utilized for their planned use. The analysis assumes development buildout occurs by year 10 (2031). A 30-year cash flow analysis has been conducted assuming that property tax rates increase by 1.0% annually and other taxes increase by 0.05% annually.

Foregone Population-based Shared Tax Revenue

Exhibit 11 shows the potential amount of population added by new development on the vacant and redevelopable land area is expected to add 1,786 new residents in the 344th site and 1,826 residents in the CFC site.

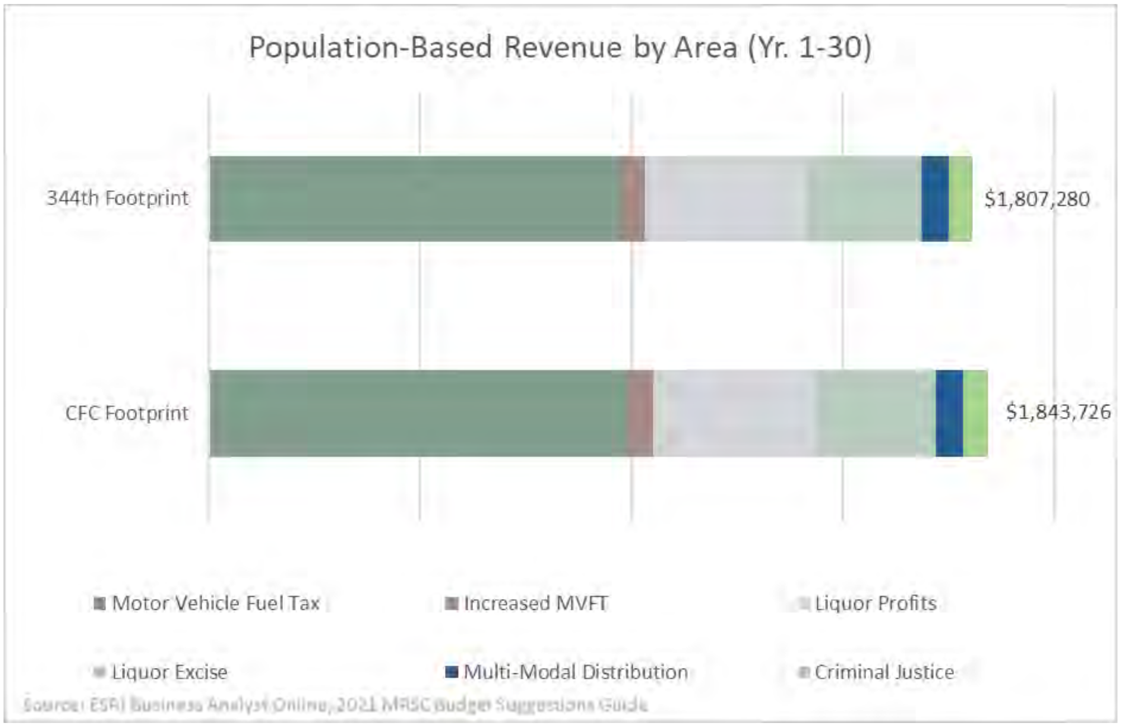
Exhibit 11: Potential Foregone Population Increase (Years 1-30)



Source: ESRI Business Analyst Online

Population is used to determine the impact of foregone state shared revenues, which are distributed based on population. The cumulative forecast of foregone population-based shared tax revenue over the next 30 years is shown in **Exhibit 12**.

Exhibit 12: Cumulative Population-Based Foregone Revenues by Site (Years 1-30)

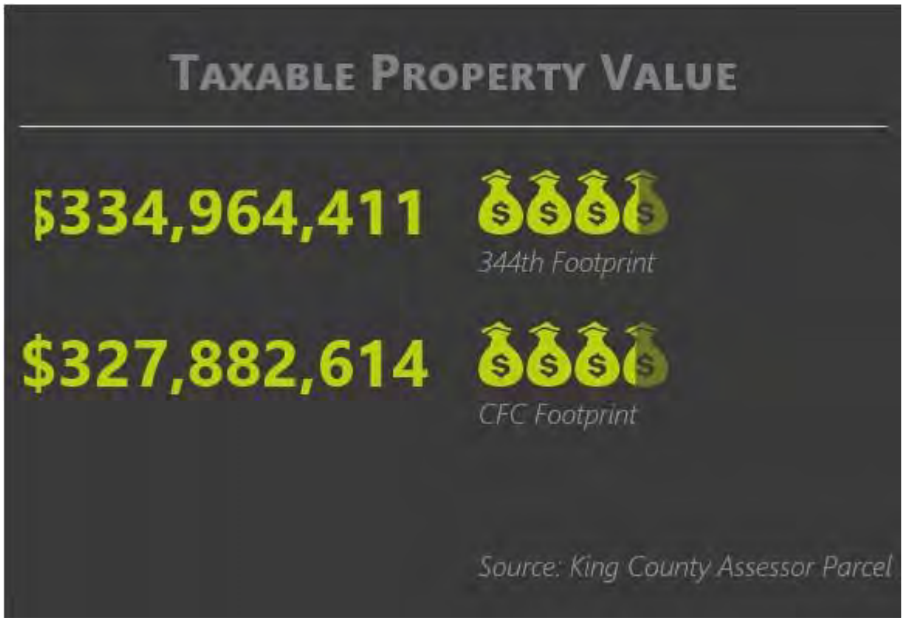


Source: ESRI Business Analyst Online, 2021 MRSC Budget Suggestions Guide

Foregone Property Tax Revenue

Development of the OMF would preclude the full buildout of the two sites, which means the City of Federal Way and other government entities would not realize property tax revenues from new development. Estimated taxable property value at buildout is shown in **Exhibit 13**. Potential foregone property tax revenue is slightly higher for the 344th footprint because there is more vacant and redevelopable land in that area.

Exhibit 13: Foregone Taxable Property Values



TAXABLE PROPERTY VALUE

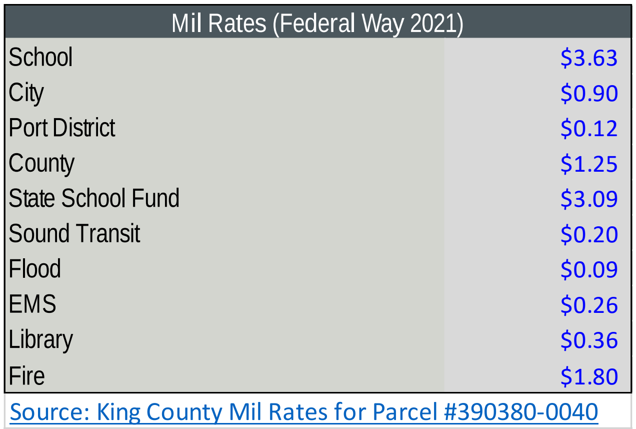
$334,964,411
344th Footprint

$327,882,614
CFC Footprint

Source: King County Assessor Parcel

Taxable property value drives property tax revenues. Figures shown above are used in conjunction with property mil rates shown in **Exhibit 14** to determine overall property tax impacts for each site.

Exhibit 14: Property Tax Rates by District (2021)

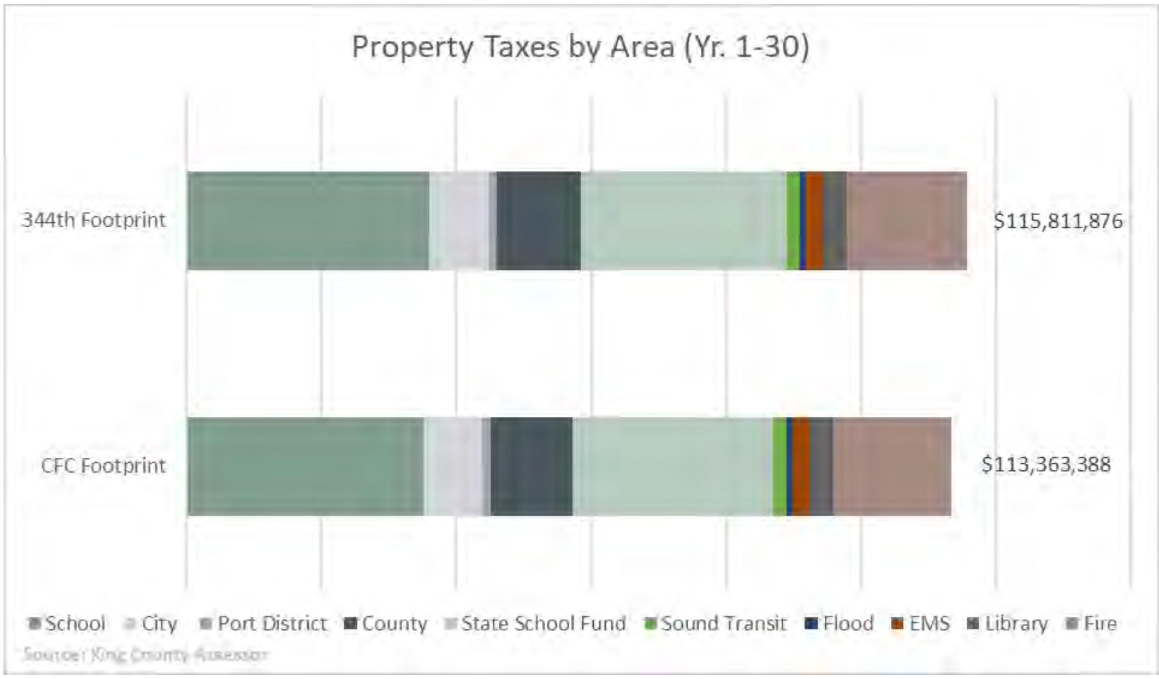


Mil Rates (Federal Way 2021)	
School	$3.63
City	$0.90
Port District	$0.12
County	$1.25
State School Fund	$3.09
Sound Transit	$0.20
Flood	$0.09
EMS	$0.26
Library	$0.36
Fire	$1.80

Source: King County Mil Rates for Parcel #390380-0040

Exhibit 15 shows the amount of foregone property tax revenue to all taxing jurisdictions, including the school district, the State School Fund, City, County, South King Fire and Rescue, and other local governments. The cumulative amount of foregone 30-year property tax revenue to all taxing districts with the 344th Site ($115,811,876) is just slightly larger than the CFC Site ($113,363,388). The amount of cumulative 30-year property tax revenue for the City is also higher with the 344th Site ($8.9 million) than with the CFC Site ($8.7 million).

Exhibit 15: Foregone Property Tax Revenues by Area (Years 1-30)



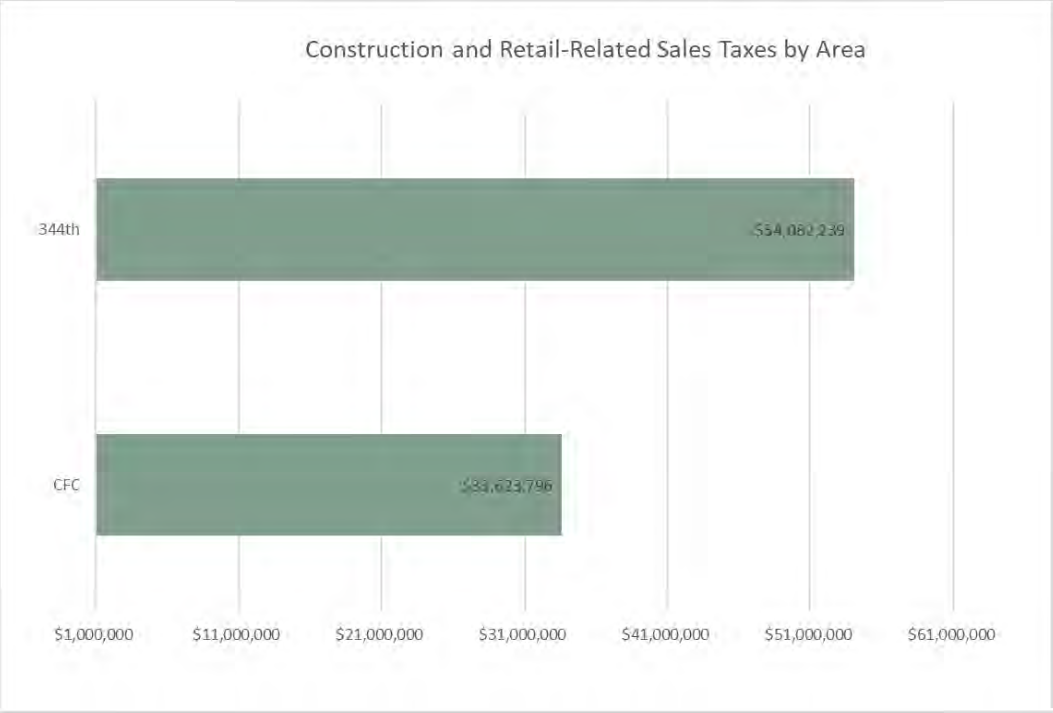
Source: King County Assessor

Foregone Sales Tax Revenue

When new development occurs, the City assesses a sales tax on construction materials that are delivered to a site. Based on the value of foregone private construction, the 344th Site is expected to result in $535 million in foregone taxable sales; while the CFC site is expected to cause about $333 million in foregone taxable construction value.

Applying current (2020) retail sales tax rates, the amount of foregone state and local sales tax revenues have been projected for both sites (**Exhibit 16**). The cumulative amount of foregone state, county and City sales taxes from OTF development are projected to range from $54 million with the 344th Site to nearly $34 million in the CFC Site.

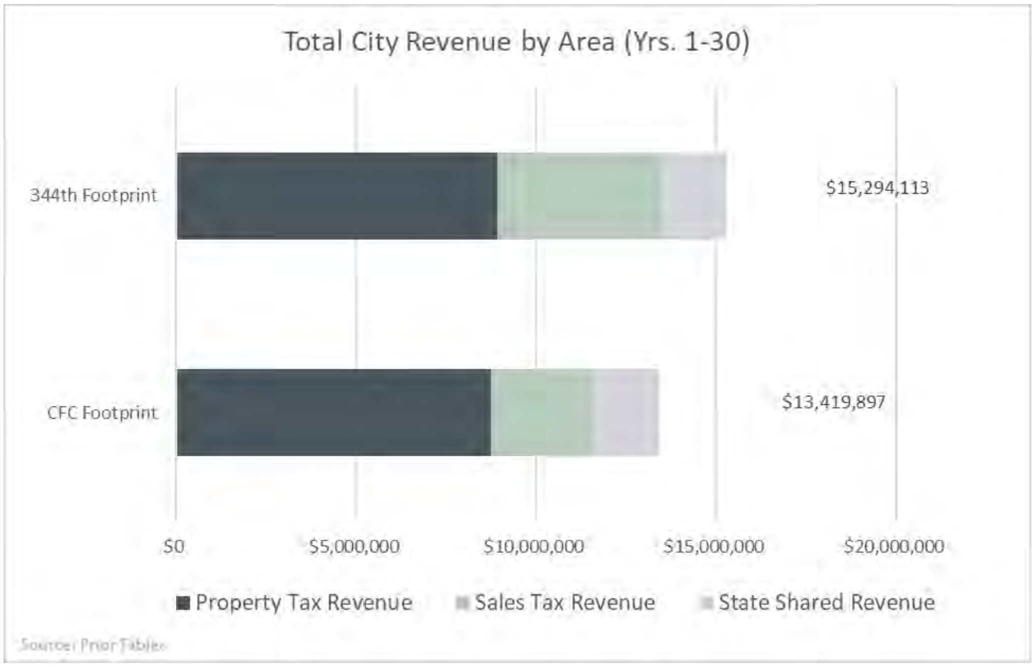
Exhibit 16: Cumulative Foregone Sales Tax Revenues (Years 1-30)



Summary of Opportunity Costs

The long-term opportunity cost of foregone tax revenues for the City of Federal Way are summarized in **Exhibits 17 and 18.** The combination of foregone property tax revenue, sales tax revenue and state-shared tax revenue is forecasted to range from $13.4 million with the CFC Site to $15.3 million with the 344th Site.

Exhibit 17: Cumulative Foregone Revenues, City of Federal Way, Years 1-30



Source: Prior Tables

Exhibit 18: Cumulative Foregone Revenues, City of Federal Way, Years 1-30

	344th Footprint	CFC Footprint
State Shared Revenue		
Motor Vehicle Fuel Tax	$974,000	$991,787
Multi-Modal Distribution	$64,768	$66,218

Subtotal Sales Tax Revenue	$54,082,239	$33,623,796
Subtotal Federal Way Revenue	$15,294,113	$13,419,897
Subtotal Other Government Revenue	$156,407,282	$135,411,012
Total Revenue	$171,701,395	$148,830,910

Summary of Housing and Employment Impacts

The housing and population-related opportunity costs would be the same for both site options. As indicated in **Exhibit 19**, it is conservatively estimated that the vacant and redevelopable RM3600 zoned land can accommodate 1,216 new dwelling units and 1,844 people once developed. It is estimated that there would be a variation in the amount of housing and population displaced between the site options.

After accounting for potentially displaced population, the net opportunity cost of the OTF is forecasted to range from 1,158 housing units (1,786 people) with the 344th Site and 1,198 dwelling units (1,826 people) with the CFC Site (**Exhibit 19**).

Exhibit 19: Opportunity Cost of Foregone Housing and Population Growth

Net New Population If Vacant and Redevelopment Land is Developed Under Current Zoning

	344th Parcels	CFC Parcels	Shared Parcels
New Dwellings Added*	1,216	1,216	1,216
Less Vacancy Allowance	4%	4%	4%
Avg. People per Dwelling Unit*	1.58	1.58	1.58
People in New Development	1,844	1,844	1,844

Net New People Added	1,786	1,826	1,844
Net New Housing Units Added	1,158	1,198	1,216

* based on multifamily housing residual land value analysis in Appendix.

The opportunity cost of foregone job growth varies by Site. As shown in **Exhibit 20**, using the current mix of employment types, the amount of foregone private-sector job growth is expected to range from 90 jobs with the CFC Site to 188 jobs with the 344th Site.

Exhibit 20: Permanent Employment Impact Analysis

Employment Analysis without OMF	344th Site	CFC Site	Shared Parcels
Existing Employment (2021)	**156**	**218**	**35**
Potential Light Industrial Jobs Added	115	49	36
Potential Commercial Jobs Added	110	46	34
Less Jobs Displaced	(38)	(5)	(5)
Net New Jobs Added without OMF	**188**	**90**	**66**
Total Existing and Potential Jobs without OMF	**344**	**308**	**101**
Employment Analysis with OMF			
Existing Direct Employment (2021)	**156**	**218**	**35**
Potential OMF Jobs On Site	476	476	n/a
Less Existing and Potential Jobs Displaced	(344)	(308)	(101)
Total Existing and Potential Jobs with OMF	**288**	**386**	n/a
Difference in Jobs with and without OMF	**55**	**(77)**	

Excludes potential employment on multifamily-zoned land.

According to the Sound Transit Draft Environmental Impact Statement (DEIS), the OMF will generate about 476 relatively high wage direct jobs on site. After accounting for potentially displaced jobs, the OMF would likely result in a net increase in jobs with the 344th Site (55 jobs), and a decrease in jobs with the CFC Site (-77 jobs).

SUMMARY OF FINDINGS

This Memorandum evaluates the opportunity cost to local and state governments if vacant and underutilized land is developed for the OMF. When vacant and underutilized land is not developed by private (or not-for-profit) entities at its highest and best use it will not produce governmental tax revenues, jobs or housing. This in-turn represents a long-term opportunity cost associated with foregone future tax revenues, jobs and housing.

The buildable land analysis identified 31.43 acres of vacant and redevelopable land within the 344th Site, including 24.23 vacant acres and 7.20 acres of redevelopable land area. The majority of this vacant and redevelopable land (15.75 acres) is planned for higher density multifamily housing with an underlying zone classification of RM3600. The 344th Site also includes 15.68 acres of vacant and redevelopable Commercial Enterprise (CE) and Business Commercial (BC) land area.

The CFC Site includes 21.06 acres of vacant/redevelopable land area, with 18.49 acres of vacant land and 2.57 acres of redevelopable land. All of the vacant multifamily land is shared between the two sites.

The opportunity cost analysis assumes that vacant and redevelopable multifamily-zoned tax lots are fully developed by year 10 (2031) based on their underlying zoning and development standards. For analysis purposes, it is assumed that this land is developed by a for-profit developer and allowances have been made for potential housing and employment displacement. The analysis also conservatively assumes that the vacant land impacted by critical lands is not able to transfer development density to unconstrained portions of their sites.

While the short-term economic impacts of the Covid-19 pandemic are still being felt, the long-term economic growth for the Puget Sound Region, King County and City of Federal Way is very positive. If Federal Way's 4.4% share of King County's population growth holds constant, the City would be on tap for accommodating over 20,000 additional people (7,500+ housing units) by year 2040.

After accounting for potentially displaced population, the net opportunity cost of the OTF is forecasted to range from 1,158 housing units (1,786 people) with the 344th Site and 1,198 dwelling units (1,826 people) with the CFC Site.

After accounting for potentially displaced jobs, the OMF would likely result in a net increase in jobs with the 344th Site (55 jobs), and a decrease in jobs with the CFC Site (-77 jobs).

With development of the OTF, the combination of foregone property tax revenue, foregone sales tax revenue and foregone state-shared tax revenue to the City of Federal Way over the next 30 years is forecasted to range from $13.4 million with the CFC Site to $15.3 million with the 344th Site.

In summary, the overall opportunity cost attributed to the OTF facility varies marginally depending upon the site that is chosen. While direct employment within the study area could be higher with the OTF, the level of foregone tax revenues and reduction in housing development potential in the area is significant.

Ratio of Land Value to Improvement Cost	**0.04**
Avg. Densitiy (dwellings per acre)	*77*
Site Size (acres)	*15.7*
Site Size (sqft)	*685,634*

SUMMARY of Revenue Assumptions	
Year 12 Sale or Refinance Fees/Costs	5.0%
Cap Rate	5.0%
Year 12 Sale or Refinance Value	**$509,952,000**
Annual Rent Rate escalation	2.8%
Annual Op. Expense Rate escalation	2.8%

Assessed Value & City Property Tax Created	
Project Improvement Value	$359,463,943
Project Land Value	$14,835,181
Project Total Value	$374,299,124
Assessed Value to Market Value Ratio	90%
Estimated Assessed Value	$336,869,211
Property Tax Rate per $1,000 AV	$11.70
Net New AV Created	$323,517,549
Annual Value of Tax Payments	**$3,785,000**
Annual Net New City Tax Revenue	**$292,010**

Comment ID	Comment Text	Response
1	We recognize that Sound Transit is building new transit infrastructure to support sustainable growth in our region. In doing so, Sound Transit should not make a decision that will have a lasting negative impact. Environmental review by the way of NEPA and SEPA was implemented at the Federal and State levels to evaluate the impacts of government decisions in order to prevent them from causing unnecessary impacts to communities like those that the OMF-South will have in Federal Way. The 336th Street site will remove a church, a school, and a daycare that serve our community as well as residences and other businesses. The 344th Site will remove multiple churches, 20 residences, and a dozen businesses, including the GarageTown community that the DEIS presents as a single business but is in fact made up of over 60 unique owners and Ellenos Real Greek Yogurt, which recently invested millions of dollars in improvements to their regional and growing business. The Midway Landfill would displace significantly fewer businesses and employees, no residents, and no civic institutions.	Please see the response to Common Comment 4 in Table L.1-1, Response to Common Comments, in the Final EIS.
2	The DEIS presents a clear preferred alternative when the impacts are considered and it is the Midway Landfill. In accordance with NEPA and SEPA, cost is not an Environmental Impact, however the prepared DEIS clearly shows that Sound Transit has elected to include costs within the decision matrix. In considering the overall impacts and a robust environmental review process, cost cannot be a factor in your decision, the impacts to the Federal Way sites are significant and will be far too detrimental to our community.	In addition to considering the potential impacts of the alternatives to the natural and built environment, the Sound Transit Board considered other factors, including cost, schedule, and input from Tribes, agencies, and the public in identifying the Preferred Alternative for the project. While cost is not an element of the environment, it is an important factor in determining whether an alternative is reasonable and feasible and should be considered through the NEPA/SEPA EIS process.
3	The DEIS inaccurately assumes the City of Federal Way will approve vacating public roads, that City staff will modify our Development Standards to permit this development that would not be approved of other public or private developers, or that adequate mitigation to these items could be found. We strongly object to Sound Transit's finding of regulatory certainty on behalf of the Federal Way sites by unilaterally assuming City approval. Additionally, Sound Transit does not have adequate authority to commit to the City of Federal Way to a future legislative act in vacation of opened and utilized public right of way.	Sound Transit recognizes that the city of Federal Way has regulatory authority over the development of OMF South, as legislative approval would be needed to vacate 20th Avenue S and for deviations from the maximum block standards. Sound Transit acknowledges that the outcome is not assured. Section 3.4, Land Use, of the 2023 Draft EIS and this Final EIS states this more directly.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
4	The City and Sound Transit have a shared interest in the success of the light rail system and have enjoyed a successful partnership on the Federal Way Link Extension to date. We have seen and heard from Sound Transit a willingness to look to the future and make the decisions that are in the best interest for the future of this region. In this spirit, we ask that the Sound Transit Board remove the two Federal Way locations and select the Midway Landfill as the preferred alternative and the site of the new OMF-South.	The Final EIS continues to evaluate all three build alternatives: South 336th Street (Preferred Alternative), South 344th Street, and Midway Landfill. The Sound Transit Board will select the project to be built after publication of the Final EIS.
5	Construction Cost and Schedule The DEIS prominently presents cost and construction schedule information in the executive summary, body of the DEIS, and in presentations to the public on the same level as displacements, ecological impacts, and other environmental impacts. Cost to the developer is not a factor of consideration in SEPA reviews or an applicable environmental element in the WAC that has to be considered. The DEIS does not clearly identify the basis for consideration of construction costs so City staff is unable to provide comment beyond that it is not an environmental impact and should not be considered in the EIS. By putting forth these three alternatives in the DEIS, Sound Transit has identified them as reasonable alternatives and should consider them against their environmental impacts alone. If Sound Transit determines inclusion of costs is appropriate and should remain part of the EIS, then the discussion must be comprehensive for all three alternatives. High-level construction cost information was included for the Midway Landfill, but not for the other alternatives. Comparable evaluation of the relocation, property acquisition, and environmental mitigation would be necessary to understand how cost factors into the analysis being performed in the EIS. If such an analysis is not complete, then it should be noted why not further study is required and the actual costs should be removed and discussed at a summarized, conceptual level only.	The opinion of probable cost and annual operating cost estimates for all three OMF South build alternatives are described in the Executive Summary and Section 2.5, Funding and Opinion of Probable Cost in the Final EIS. The opinion of probable cost includes construction and demolition (including environmental mitigation); property acquisition and relocation assistance; design, permitting, and program management; and allowances for construction contingencies. Estimates for annual operating costs include long-term expenses to maintain the facility, as well as operating costs associated with trains deploying from and returning to the OMF each day. Additionally, annual mainline maintenance expenses for the South 336th Street and South 344th Street alternatives would apply until TDLE is completed. The estimates are presented as ranges to reflect the conceptual nature of the project design at this phase of development, and the same cost estimating methodology was used for all three sites to allow comparison between alternatives.
6	Other questions left unanswered with regards to cost include: • Is Sound Transit limiting their ability to seek Federal assistance by building the mainline as part of a project not subject to NEPA?	Please see the response to Common Comment 5 in Table L.1-1, Responses to Common Comments, in the Final EIS.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
7	- Why is the additional maintenance cost for the Midway site not addressed?	The additional annual operations and maintenance costs for the Midway Landfill were discussed in the Executive Summary and Section 2.6 of the 2021 Draft EIS, which is now Section 2.5, Funding and Opinion of Probable Cost, in the Final EIS. Annual maintenance costs for the Midway Landfill Alternative include expenses to address potential risks posed by settlement and methane gas over the lifespan of the facility as well as higher operating costs for the trains to deploy each morning before passenger service begins and to return to the OMF each night after passenger service has shut down.
8	- What is the estimated cost of the mainline construction? Alteration to the BPA Power Lines?	Estimated capital costs for mainline design and construction were reported in Table 2.6-1 of the 2021 Draft EIS. This information has been updated in Section 2.5, Funding and Opinion of Probable Cost, in the Final EIS. Depending on the design option, the estimate ranges from $338 million to $695 million. The relocation and alternation of the BPA power lines has a comparative cost estimate of approximately $8 million.
9	- Why does the Midway Landfill Site consider additional costs for settlement even on the option to completely remove the waste from the site?	The Midway Landfill site assumes the risk of additional settlement because, even after completely removing the landfill waste, the excavation must be replaced with new soil up to 80 feet deep. Complete compaction is difficult to achieve with that volume of fill. A considerable amount of time to achieve consolidation would be needed, adding to project schedule and cost.
10	- The operating cost difference is not addressed in the DEIS, what is the reason for this difference?	The increased operating cost for the Midway Landfill Alternative is due to potentially greater maintenance concerns and higher train deployment operations costs, as described in Comment ID 7.
11	As with the discussion on costs, schedule is not a typical environmental element. With no basis for inclusion provided, all discussion about construction schedule should be removed from the DEIS or considered comprehensively for all three site alternatives. As discussed under the City's comments on transportation impacts, both Federal Way alternatives require improved public rights-of-way to be vacated. The vacation process is expected to take 18-24 months and is a Council legislative action. This will add significantly to the timeline.	Section 2.3.4, Construction Methods, Sequence, and Activities, in the 2023 Draft EIS and this Final EIS discusses the anticipated construction schedule for all three OMF South alternatives in addition to the three construction design options for the Midway Landfill Alternative. The overall project schedule accounts for completion of the EIS process, development of final design, property acquisition, and permitting, including local development permits and approvals, such as street vacations.
12	*Page 2-24* - Work hour variance approvals will be required for the construction schedule presented to be allowed in Federal Way.	Permits and approvals for construction will be coordinated during the final design phase.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
13	*Page 2-29* • Section 2.6 just covers cost estimates. Where is a discussion on funding on this section?	The purpose of the EIS process is to identify the potential impacts to the natural and built environment. The cost estimates were included for comparison purposes. A detailed cost breakdown or discussion of funding sources is not included in the Final EIS. The OMF South project is currently planned to be funded through the Sound Transit 3 program and federal funding. Please see Common Comment 5 in Table L.1-1, Response to Common Comments, in the Final EIS for more information of federal funding sources.
14	*Page 2-31* • Do these dates consider Sound Transit's realignment effort? • Based on the outlined schedule, 2024 is not a realistic start of construction with required ROW vacations. • Table 2.7-1 does not present a feasible schedule including the Right of Way vacation process for FW. Sound Transit needs to review that and incorporate into schedule. Right-of-way vacation would need to start approximately early Summer of 2021 for the proposed schedule to be accomplished. • The requirements, mitigation and processes for Right of Way vacation are not identified or included within the DEIS.	Dates in the 2021 Draft EIS do not reflect the realignment effort. The 2021 Draft EIS was published before the Sound Transit Board approved project realignment priorities in August 2021. The dates in the 2023 Draft EIS and this Final EIS account for realignment. The overall project schedule includes completion of the EIS process, development of final design, property acquisition, and permitting, including for local development permits and approvals, such as street vacations. Section 3.4.2, Consistency with Regional and Local Comprehensive Plans and Zoning, in the 2023 Draft EIS and this Final EIS references Federal Way Revised Code Chapter 4.20 for the requirements, mitigation, and processes for street vacations.
15	**Transportation Impacts** Both site alternatives in Federal Way, 336th St and 344th St., remove improved public rights-of-way and a north-south road connection. 341st Pl., 344th St., and 20th Ave. S., are all identified in the Federal Way Comprehensive Plan as minor collectors (refer to Map III-3). Additionally, they are each a bicycle route identified in Map III-16. The DEIS indicates the shared markings are an unfunded project when the project is currently out to bid. Additionally, the trip distribution model presented does not redistribute trips from the roads proposed for vacation.	Section 3.2, Transportation, of the 2023 Draft EIS was updated to note current and constructed bicycle and pedestrian facilities. Traffic forecasts and distribution were completed using a conservative method to determine what impacts might occur at the OMF South site alternatives. The project team has refined the forecasts to account for street vacations, updated staffing levels for OMF South, and included realignments of the OMF access locations. These updates are reflected in this Final EIS.
16	The following comments relate to Section 3.2 of the DEIS: *Page 3.2-5* • Level of Service is not the basis for defining impacts associated with right-of-way vacations. Refer to FWRC Chapter 4.20.	Sound Transit would pursue the vacation of right-of-way in accordance with City of Federal Way Revised Code Chapter 4.20, Vacation of Streets. Please see Section 3.4, Land Use, in the 2023 Draft EIS and this Final EIS.
17	*Page 3.2-7* • While Section 3.2.1.4 may be correct that the Midway Landfill is primarily served by routes on Hwy 99, the Federal Way sites include Pierce Transit routes split between 336th St., Hwy 99, and 16th Ave S. King County only has a commuter route on Hwy 99.	The 2023 Draft EIS was updated to include locations of transit bus stops on S 336th Street and 16th Avenue S. Figure G1.3-15 in Appendix G1, Transportation Technical Report, shows the bus routes in the transportation study area associated with the Federal Way sites. These updates are reflected in this Final EIS.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
18	*Page 3.2-11* - Regarding Section 3.2.1.6, the City is in the process of updating on-street parking restrictions in the area and the rule will be in effect this summer.	The 2023 Draft EIS and the Final EIS describe the parking requirements currently in place in the study areas. Please see Section 3.2, Transportation, in the Final EIS and Section 3.6, Parking, in Appendix G1, Transportation Technical Report.
19	- Regarding Section 3.2.1.7, the number of collisions is only one part of the safety measures the City uses and is meaningless by itself. For intersections, the City uses collision rate (collisions per million entering vehicles); societal cost; and severity rate (societal cost per million entering vehicles). The DEIS should use these measurements as they are more useful to determining whether mitigation is needed and will ultimately be required as part of Concurrency permitting of the sites.	Section 3.2, Transportation, of the 2023 Draft EIS and this Final EIS include an analysis of crash data that use the city of Federal Way's approved methodology for determining collision rates. Each OMF South alternative was analyzed using the same type of data and methodology to allow for an equal comparison among alternatives. Therefore, the societal cost of collisions per million entering vehicles (MEV) was not included in the analysis. The analysis assesses accidents currently occurring within the project limits for each alternative in terms of type, cause, and as described in the transportation section of the Environmental Methodology Report (2019) reviewed by the city of Federal Way and other members of the Interagency Group.
20	*Page 3.2-14* - Verify that Pierce Transit will continue their service long-term. They have stated they intend to truncate their lines at the South Federal Way Station when TDLE opens.	The 2023 Draft EIS and this Final EIS describe the transit routes that are anticipated to serve the study areas. Please see Section 3.2, Transportation, of the Final EIS and Section 3.4, Transit, in Appendix G1, Transportation Technical Report.
21	- Installation of shared marking lines for bicycles is currently out to bid.	The 2023 Draft EIS and the Final EIS describe the current and planned bicycle and pedestrian facilities, including those developed since the 2021 Draft EIS was published. Please see Section 3.2, Transportation, of the Final EIS and Section 3.5, Nonmotorized Facilities, in Appendix G1, Transportation Technical Report.
22	*Page 3.2-15* - Why not use a travel demand model for more realistic trip assignment, especially when roadway closures would redistribute trips?	The transportation analysis used the PSRC Regional Travel Demand Model, which is not validated at the local level. The trip assignment was developed manually based on local changes to roadways and access, consistent with the Transportation Technical Analysis Methodology, which was reviewed by the city of Federal Way.
23	*Page 3.2-23, Table 3.2-8* - Standard v/c is 1.0 at unsignalized intersections in Federal Way. - V/c needs to be reported for all intersections in Federal Way	Tables 3.2-6 through 3.2-9 of the 2023 Draft EIS and this Final EIS show a v/c standard of 1.0 at unsignalized intersections in Federal Way. The v/c standard is shown for all Federal Way intersections that were studied.
24	*Page 3.2-39* - The City can provide actual traffic counts upon request and Table 3.2-17 as well as other sections of the report can be updated to provide more accurate information. AADT is not typically presented as a range.	Sound Transit requested additional AADT data from Federal Way. The partial data provided was not applicable to the analysis.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
25	*Page 3.2-41* - All signage is required to be reflective regardless, so providing it is not a mitigation measure.	The referenced text was drawn from the list of avoidance and minimization measures that could be used; it was not listed as a unique mitigation measure. The avoidance and minimization measures include actions that are considered best management practices and also actions that are required by code.
26	*Page 3.2-42* - Section 3.2.3 is incorrect for Federal Way sites as the facility has long-term planning and operational impacts by not providing a road network consistent with City Development Standards and removing existing roads incorporated into the Comprehensive Plan.	Sound Transit has revised the South 336th Street Alternative design to extend 18th Place South between S 340th Street and S 336th Street to replace 20th Avenue S. There would be no replacement for 20th Avenue S under the South 344th Street Alternative. Even so, the removal of 20th Avenue S is not anticipated to result in long-term operational impacts to freight, transit, nonmotorized transportation, parking, or safety.
27	***Alternative Methodology – Transportation*** The trip distribution modeling needs to address the redistribution of existing trips based on the proposed conditions. Further analysis and appropriate mitigation is required as part of any request for a right of way vacation under Federal Way code.	The traffic operations analysis in Section 3.2, Transportation, and Appendix G1, Transportation Technical Report, of the 2023 Draft EIS and this Final EIS accounts for roadway closures and redistribution of trips, as requested by this comment. If the Board selects to build the Preferred Alternative or the S 344th Street Alternative, Sound Transit would pursue vacation of right-of-way in accordance with city of Federal Way code requirements. Please see Section 3.4, Land Use, in the Final EIS.
28	***Mitigation - Transportation*** No mitigation for the loss of the roads or alternate travel routes is identified nor do the conceptual designs meet Federal Way Development Standards for vehicular block perimeter. The City of Federal Way requires the project mitigate all public roadways being vacated by incorporating roadways of identical functionality for vehicles, pedestrians, and bicycles in a manner that complies with the City's block perimeter requirements and Comprehensive Plan.	Sound Transit has revised the design for the South 336th Street Alternative, which has been identified as the Preferred Alternative, to include construction of an 18th Place S extension between S 336th Street and S 340th Street. Sound Transit would continue to coordinate with the city of Federal Way to comply with Federal Way Revised Code Chapter 4.20, Vacation of Streets. If the Board were to select the South 344th Street Alternative as the project to be built, Sound Transit would work with Federal Way to address the street vacation concerns for that alternative.
29	**Public Safety** The DEIS correctly states that the City of Federal Way has expressed concerns over the potential effects on response times from either the 336th St. or 344th St. alternatives. 20th Ave. functions as a bypass road for Pacific Highway and 16th Ave. that provides an alternative north-south route for officers who may be responding from anywhere in the City. Section 3.14 states that "it is not possible to accurately determine how the road closure would affect their response time." While then concluding that "the closure [of 20th Avenue] would likely have very little impact on their response time to the area". We disagree that this impact to response times is insignificant. Given that this issue was identified prior to the publication of the DEIS and no mitigation is provided, there must be an analysis to justify the findings in the EIS.	Section 3.14, Public Services, of the 2023 Draft EIS and this Final EIS includes an analysis of the changes to response times for emergency vehicles if the South 344th Street Alternative is selected as the project to be built and 20th Avenue S is vacated. The analysis found that emergency response would be minimally affected by the closure of 20th Avenue S. After the 2021 Draft EIS, Sound Transit revised the design of the Preferred Alternative to include an extension of 18th Place S to replace the function of 20th Avenue S. It is expected that emergency vehicles would use the 18th Place S extension to access properties to the south of the alternative and there would be no need for emergency services to change their operations to facilitate the realignment. Therefore, there would be no adverse effects on travel or response times for public service vehicles, including fire, emergency medical, and police.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
30	***Mitigation – Public Safety*** Incorporate a replacement north-south connection parallel to 16th Ave and Pacific Highway for emergency vehicle response. This mitigation overlaps with the requested mitigation for the impacts to the city road network.	After the 2021 Draft EIS, Sound Transit updated the Preferred Alternative design to include an extension of 18th Place S to replace the function of 20th Avenue S. Please see Section 2.2.8, Design Updates, in the 2023 Draft EIS and this Final EIS for a description.
31	**Economic and Fiscal Impacts** The following comments relate to Section 3.5: • Sound Transit should provide actual counts for employee displacements rather than estimates.	Please see response to Common Comment 1 in Table L.1-1, Response to Common Comments, in the Final EIS
32	• Property taxes as a snapshot in time should easily be calculable as they are published every tax year by the King County Assessor's Office.	Table 3.5-4, General Fund Revenues for the cities of Kent and Federal Way, in the 2023 Draft EIS and this Final EIS lists property tax revenues for both cities. The numbers were drawn from each city's adopted 2020 budget.
33	• The DEIS does not consider the opportunity cost difference between the three sites. As a landfill and Superfund site, the Midway site will likely have a low opportunity cost. City staff contracted with the FCS Group to assess the opportunity cost of the Federal Way's sites. The findings include that the 344th St. and 336th St. sites have 31.4 and 21 acres of vacant or developable land respectively based on King County buildable lands guidance. As the OMF-South will represent a permanent change of land use to public/institutional, the diminished capacity for population and employment growth for the region that change in use represents needs to be considered.	SEPA and NEPA do not require analysis of economic opportunity costs of land use decisions but rather an evaluation of environmental and economic impacts on existing and reasonably foreseeable future land uses for each built alternative. Section 3.4, Land Use, of the 2023 Draft EIS and this Final EIS describes the current zoning and the amount of land converted to a transportation use. It states that this land would no longer be available for other development.
34	*Table 3.5-8, Table 3.5-5* • The City had the FCS Group review potential employment. Their review found general concurrence with the baseline for the estimated employees directly displaces, but found the impact of those jobs lost would cause a significant number of additional jobs to be lost in the area. In total, the OMF-South will result in $30-50 million in lost economic output depending on what site is chosen.	The Final EIS does not estimate these secondary effects of economic loss because 1) while jobs would be displaced by site acquisition, it is premature to assume that these jobs would be losses to the city much less to region as whole (i.e., firms can relocate or consumers can adjust their spending to other substitutes); and, 2) subsequently, applying a regional multiplier to these jobs displacements is not supported by any analysis that these jobs would in fact be lost to the region or whether these indirect/induced jobs were even in the city to begin with.
35	• We understand the information presented to be based on the conceptual 10% OMF-South plans. However, the DEIS needs to acknowledge that any change to the design that expands the footprint will not be inconsequential. Environmental mitigation, additional transportation improvements, and stormwater management are all risks to the footprint expanding. The immediate area surrounding either Federal Way site alternative supports over 300 additional jobs.	As described in Chapter 2, Alternatives Considered, of the 2023 Draft EIS and this Final EIS, the Preferred Alternative (South 336th Street) footprint has been expanded to include additional parcels. The discussion of impacts has been updated to address these changes. Any further revisions to the site layout after publication of the Final EIS would be evaluated to determine whether additional environmental review would be necessary.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
36	*Page 3.5-9* • Reference to fiscal impacts as small is a matter of opinion. The DEIS language should be neutral. • Clarify whether the proportion of assessed valuation is based on assessed valuation or taxable valuation. As all land and buildings typically have an assessed valuation if they are tax exempt, such as government buildings or developments receiving special tax exemptions. Taxable valuation is more relevant to assessing economic and fiscal impacts.	The referenced analysis was based on the taxable value listed in Table 3.5-6, Total Taxable Assessed Valuation by Alternative, in the 2021 Draft EIS. While it is true that taxable value is important from a taxpayer perspective, due to the budget-based property tax system in Washington, it is unlikely that the taxable value issue would have an immediate impact on property tax revenues. The city's ability to levy its legislative maximum authority would be unchanged based on losses to either its total or taxable assessed valuation base.
37	***Alternative Methodology - Economics*** • Provide an accurate count for the purposes of employment displacement.	Please see response to Common Comment 1 in Table 5.5-1, Response to Common Comments, in the Final EIS.
38	• Consider indirect and induced job loss, as well as economic output loss.	Section 3.5, Economics, of the 2023 Draft EIS and this Final EIS lists estimated business and employee displacements for each alternative. Some displaced businesses may choose to relocate in the same area, while others may not. Since the relocation decisions are determined by individual business owners, the Final EIS does not calculate a net job gain/loss. The number of displaced employees is based on the business building size (King County Department of Assessment data) and the type of business activity using square-foot-per-employee factors from the U.S. Department of Energy and the Institute for Transportation Engineers and not on an actual survey of businesses.
39	• Address the level of risk and the potential consequences to the OMF-South footprint expanding as design progresses. Further plan development beyond 10% may be required to provide this information and an accurate comparison with the three sites.	As described in Chapter 2, Alternatives Considered, of the 2023 Draft EIS and this Final EIS, after publication of the 2021 Draft EIS, the footprint of the Preferred Alternative (South 336th Street) was expanded to include additional parcels. The discussion of impacts was updated to address these changes.
40	• Evaluate and assess the impact to growth capacity and the economic opportunity costs for the three alternative sites.	Section 3.5, Economics, of the Final EIS does not evaluate potential opportunity costs. However, the section does state that the conversion of commercial land to a transportation use would make it unavailable for other uses. See also Section 3.4, Land Use. The net economic effect of these changes can be uncertain given the relocation decisions of displaced businesses as well as market factors influencing development in the city. SEPA and NEPA do not require analysis of economic opportunity costs of land use decisions but rather an evaluation of environmental and economic impacts on existing and reasonably foreseeable future land uses for each built alternative.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
41	The City has evaluated the 344th St. and 336th St. sites and found the potential impacts to tax revenue to be even greater than estimated impacts based on current development. Industrial vacancy rate in the City is approximately 0.5% and the lost employment opportunities represent a 50% to 100% increase in direct employment effects.	This comment references a city-prepared analysis that contemplates the "opportunity costs" of siting OMF South in Federal Way. The analysis frames the opportunity cost as those exacted on the city from 1) the displacement of existing businesses and 2) the forgone value of future redevelopment of vacant and underutilized parcels in terms of employment and taxes. The Final EIS addresses displacement of existing businesses by estimating the amount of employment loss from business displacement. Additionally, it identifies the amount of land that would be converted to transportation use. The Final EIS does not estimate potential losses stemming from a future development scenario where those lands are developed as uses and capacities consistent with the underlying zoning, because scenarios that might be entertained on those affected parcels would involve a high degree of speculation, particularly in terms of scale and timing of development.
42	***Land Use Impacts*** *The following comments relate to Section 3.4:* *Page 3.4-20* An essential public facility (EPF) is allowed in all zones consistent with State Law and pursuant to FWRC 19.105.020. The design has not progressed to a point for specific mitigation to be discussed, but at a minimum land use compatibility measures consistent with Federal Way Revised Code is required. The project is also expected to comply with community design guidelines under FWRC 19.115.	As stated in Section 3.4, Land Use, of the 2023 Draft EIS and this Final EIS, OMF South is generally consistent with the city of Federal Way Comprehensive Plan as well as the intent of the zones that it would occupy within the footprints of the Preferred and South 344th Street alternatives. Sound Transit acknowledges that light rail transit facility uses are explicitly recognized only in the portion of the site zoned Commercial Enterprise (CE). Where the use is not explicitly recognized, Sound Transit would continue to meet zoning code and intent to the extent practicable during the land use approval process.
43	*Page F2-10* • Table F2-4 is incomplete without acknowledging that OMF-South is considered an EPF and will be reviewed under FWRC 19.105.020.	Table H2-3 in Appendix H-2, Land Use Technical Appendix, of the 2023 Draft EIS and this Final EIS include this information.
44	*Page F2-13* • The information presented in Appendix C is not sufficient to justify the finding that the response to LUP14 is accurate or feasible. • With regards to the comment on LUP23, how is a finding that alternative facilities could be developed consistent with the lack of provision of alternative facilities in the conceptual designs presented in Appendix C? One of the alternative stretches from I-5 to 16th Ave. which eliminates the possibility for an alternative facility.	See Section 2.3, Project Alternatives, of the Final EIS for the description of the Preferred Alternative, which reflects design updates made since the 2021 SEPA Draft EIS. The design now includes a replacement of 20th Avenue S by extending 18th Place S between S 336th Street and S 340th Street. The design allows for bicycle use, which would meet the city's intent to provide bicycles lanes on 20th Avenue S. Appendix H2, Land Use Technical Appendix, has also been updated.
45	*Page F2-14* • Comprehensive Plan policies need to be considered in totality. The proposal does not seem consistent with LUP35 or LUP38.	Table H2-5 in Appendix H2, Land Use Technical Appendix, of the 2023 Draft EIS and this Final EIS includes discussion of Land Use Policies 35 and 38.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
46	- With regards to the finding on LUP47, the Neighborhood Business (NB) zone is not proximal to the light rail system.	The reference to LUP47 in Table H2-5 was not included in the 2023 Draft EIS or this Final EIS because it is not relevant to the OMF South project.
47	- With regards to the finding of LUP59, this sentence doesn't makes sense as this policy states that the City development code will have a process for reviewing EPFs as per State law. The policy is not for de facto EPF approval nor is approval of an EPF implementation of this policy.	Table H2-5 of Appendix H-2, Land Use Technical Appendix, was revised in the 2023 Draft EIS and again for this Final EIS to include only what is directly applicable to the proposed project. While true that the OMF is considered an EPF, Sound Transit acknowledges that LUP 59 states that the city is responsible for developing code processes for siting EPFs; LUP 59 does not state that EPFs are automatically approved.
48	***Additional Information – Land Use*** Describe the proposal in enough detail to affirm that adequate room exists for appropriate compatibility between land uses. Deference to complying with code is identified, but a specific landscape buffer and planting schematic is not. The EIS needs to verify that adequate room exists on the site for this buffering after considering construction of lead tracks, securing needs, and guideway clear zone requirements. The conceptual plans are not detail enough for us to concur that mitigation is feasible.	The 2021 Draft EIS analyzed the three build alternatives at a conceptual design level of 10 percent. Sound Transit continues to work with Federal Way to address land use compatibility. The 2023 Draft EIS and this Final EIS include a description of the Preferred Alternative in more detail, including widths of landscape buffers and frontage improvements. See Section 2.3, Project Alternatives, of the Final EIS for the description of the Preferred Alternative. Sound Transit would continue to work with the city to comply with code requirements if the Sound Transit Board selects to build the Preferred or South 344th Street alternative.
49	***Mitigation - Land Use*** EPFs are required to provide mitigation based on the level of impact which will be reviewed as the project develops and information is refined. However, it is noted that FWRC 19.25 requires a 25-foot Type 1 landscaping buffer between industrial uses and residential zoning districts. That provides a baseline as to the level of screening that will be expected for at least a portion of the 336th and 344th St. alternatives. The impact of the guideway clear zone on the ability to meet the planting performance standards must be considered.	Sound Transit is continuing to work with the city of Federal Way to address land use compatibility, including the inclusion of landscape buffers, as the project design progresses for the Preferred Alternative.
50	**Environmental and Water Resources** The DEIS notes that Sound Transit will develop plans to mitigate "the effects of the project on wetlands, streams, and regulatory buffers on a watershed basis." The work is noted as being planned to be done in accordance with Federal, State, and local requirements as well as through consultation with tribal biologists. Similarly, water resources are noted as providing of mitigation through compliance with applicable stormwater permitting requirements. Such a broad statement for purposes of mitigation is hard to refute and we encourage Sound Transit to thoroughly evaluate the feasibility of the path forward for Federal Way sites.	Work is currently underway to identify potential mitigation sites within the watershed and within the city of Federal Way to mitigate the project effects on wetlands, streams, and buffers. Should one of the Federal Way sites be selected by the Sound Transit Board as the project to be built, a comprehensive mitigation plan would be developed for review and approval.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
51	The following comments apply to Section 3.10: • Has the potential need for large, woody debris as part of the stream restoration been evaluated? This could add to any potential flooding complications.	Sound Transit would design and implement mitigation for impacts to aquatic resources to ensure compliance with regulations and permit conditions with local, state, federal, and Tribal authorities. The details of mitigation, including placement of large woody material, if required, would be developed during the permitting process and in coordination with Tribes and agencies with regulatory authority. Sound Transit would also perform hydraulic analyses, including evaluations of potential flood risks, to support permitting reviews. Large woody debris placement is commonly required by state agencies and Tribes for stream restoration proposals to provide in-stream habitats.
52	• Loss of fish habitat and associated identifiable mitigation is not included.	Section 3.10 and Appendix G3, Ecosystem Resources, includes a detailed discussion of potential impacts and mitigation measures to Aquatic Resources.
53	*Page 3.10-6* • This section notes that the West Fork Hylebos Creek Tributary is subject to flooding issues while also noting the plan is to regrade the area constricting the wetland and possibly the stream bed. There doesn't appear to have been adequate hydraulics analysis to assess the feasibility of this work as presented in Appendix C. • It is not clear how City Code will be met as part of regrading and realigning a stream channel.	As the project design advances, Sound Transit will perform detailed hydraulic analyses and ensure compliance with regulations and permit conditions with local, state, federal, and Tribal authorities.
54	*Page 3.10-11* • The S 344th St. site indicates there is a 60-foot culvert in the current designs to accommodate an emergency access road. Under FWRC 19.145 it will be very challenging to meet the requirements to build a new culvert for a stream. Alternative designs must be provided to show there is no other option and convenience is not a justification. The design needs to be updated to remove the culvert.	Section 3.10, Ecosystem Resources, of the 2023 Draft EIS and this Final EIS states that the need for a new culvert at this location is yet to be determined. If the South 344th Street Alternative is selected as the project to be built, Sound Transit would evaluate the site closely to design an emergency access road that could be built without a culvert. If a feasible alternative cannot be found, any new stream crossing structure would be designed and built in compliance with the requirements of local, state, and federal regulations.
55	*The following comments applies to Appendix G3 and is from pages G3-8 and G3-9:* • The Executive Proposed Basin Plan Hylebos Creek and Lower Puget Sound (King County 1991) should be a data source considered.	Appendix G3, Ecosystem Resources Technical Report, was updated for the 2023 Draft EIS to include pertinent information from the Executive Proposed Hylebos Creek and Lower Puget Sound Basin Plan. These updates are reflected in the Final EIS.
56	*The following comment applies to Section 3.11 and is from page 3.11-14:* • Shouldn't the relocation of the existing WSDOT stormwater facility be part of the environmental analysis? No location is identified and it is a result of the proposed project.	The OMF South project would meet stormwater requirements identified as part of the environmental analysis discussed in Section 3.11, Water Resources, in the 2023 Draft EIS and this Final EIS. Sound Transit and WSDOT are coordinating efforts to avoid or minimize impacts to the WSDOT stormwater facility.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
57	**Noise and Visual Impacts** The assessment of visual impacts by the Federal Way site alternatives, which both impact 336th at I-5, did not adequately address the presence of the historic Weyerhauser Campus immediately east. 336th St. and 344th St. site visual impacts need to be considered from former Weyerhauser property along 336th; this would likely change its level of visual impact from medium to medium-high or high.	After reviewing the Weyerhaeuser Headquarters Historic Property Inventory form in the Washington Information System for Architectural and Archaeological Records Data (WISAARD) it does not appear that the OMF South facility or tracks would be prominently visible from the Weyerhaeuser Headquarters building. The orientation of the Weyerhaeuser Headquarters Building, the trees on the campus, and the berm along I-5 would visually screen the OMF South facility and tracks. The facility and tracks would also not be visible from the Headquarters building or reflecting pool to the north of the building. Additionally, the presence of I-5 (constructed prior to the Weyerhaeuser Headquarters campus) is similar in nature to the OMF South facilities, as they are both transportation facilities. This would lessen any potential effect on the eligible building.
58	The following comments pertain to Appendix G2: - What is the source for the projected project noise level? How will this be verified against project completion?	The source noise level is based on measurements of LRVs operating on the existing Sound Transit Link light rail system. The noise levels for each source within the OMF and on the mainline are discussed in Section 3.1 of Appendix G2, Noise and Vibration Technical Report, of the 2023 Draft EIS and this Final EIS.
59	*Page G2-11* - What about bells from the light rail vehicles or other signals at crossings or upon exiting onto the tracks? This is not directly addressed.	There are no at-grade light rail crossings associated with the OMF South mainline track; therefore, there are no bells or signals that would create additional noise. As mentioned in Section 3.9.2.2 of the 2023 Draft EIS and this Final EIS, there could be limited testing of horns or bells during the daytime, but these activities would not be substantial enough to add to the noise from the OMF.
60	**Cumulative Impacts** The Commercial Enterprise (CE) zone is the only light industrial zone in the City of Federal Way and land will be converted for both the OMF-South (should a Federal Way location be selected) and the Tacoma Dome Link Extension. The cumulative impacts section discusses the impacts of light rail in the context of typical mixed-used, transit-oriented development which is not consistent with the current city industrial zoning. TDLE will be building stations in industrially zoned and/or developed lands in Fife and Tacoma (east station). Industrial land is at a premium in the region and if it is challenging for businesses displaced by transit facilities to relocate, it may push them further out to find suitable locations (as previously noted, the vacancy rate is as low as 0.5%). This related action could lead to sprawl or greenfield development and the DEIS should contemplate cumulative impacts of all known Sound Transit projects on industrial land supply based on current zoning.	Chapter 4, Cumulative Effects Analysis, of the 2023 Draft EIS was revised to include further discussion about impacts to industrial land supply not only by Sound Transit but by other developments as well. These updates are reflected in this Final EIS.
